## I. Introduction

On August 15, 2007, the Department of Homeland Security (DHS), U.S. Immigration and Customs Enforcement (ICE), promulgated a final rule titled "Safe-Harbor Procedures for Employers Who Receive a No-Match Letter" (no-match rule). As noted in the Supplementary Information section of the rule, current immigration law prohibits employers from hiring or continuing to employ an alien once the employer has knowledge that the alien is unauthorized to work in the United States [section 274A(a)(2) of the Immigration and Nationality Act (INA), 8 U.S.C. 1324a(a)(2)]. Furthermore, under the INA, an employer can be said to have "constructive knowledge" that an individual is unauthorized to work if the employer has notice of certain facts and circumstances which would lead a person, with the exercise of reasonable care, to infer that the individual is unauthorized. If an employer does receive information that raises questions about an employee's work status, but does not investigate the suspicious circumstances or attempt to validate the employee's work status, the employer cannot plead ignorance and can still be held liable.

The no-match rule clarifies the definition of "knowledge" in the regulations implementing the INA's prohibition on employment of unauthorized aliens. Specifically, the rule provides that an employer that fails to take reasonable steps in response to information calling into question an employee's work authorization may, depending on the totality of the circumstances, be found by DHS to have had "constructive knowledge" that an employee is not authorized to work in the United States. The rule further clarifies that DHS views a letter from the Social Security Administration (SSA) indicating that an employee's name and Social Security Number (SSN) submitted on the employer's Form W-2 tax filing does not match SSA records as the type of information that can be evidence of an employer's constructive knowledge. The final rule also provided the means for employers to acquire a safe harbor by following certain steps in response to such a no-match letter from SSA.

## Objective

The primary objective of this report is to provide DHS with information to prepare an Initial Regulatory Flexibility Analysis (IRFA). The Regulatory Flexibility Act (RFA) requires Federal agencies take small entities' particular concerns into account when developing, writing, publicizing, promulgating, and enforcing regulations. To achieve this, the RFA requires that agencies detail how they have met these concerns, by including an initial or final Regulatory Flexibility Analysis. An IRFA, which accompanies a proposed rule, includes the following five elements:
(1) A description of the reasons why action by the agency is being considered.
(2) A succinct statement of the objectives of, and legal basis for, the proposed rule.
(3) A description of and, where feasible, an estimate of the number of small entities to which the proposed rule would apply.
(4) A description of the proposed reporting, recordkeeping, and other compliance requirements of the proposed rule, including an estimate of the classes of small entities that would be subject to the requirements and the type of professional skills necessary for preparation of the report or record.
(5) An identification, to the extent practicable, of all Federal rules that may duplicate, overlap, or conflict with the proposed rule.

Econometrica, in this report, provides information to make findings under items 3 and 4 above; i.e., information on the number and types of small entities that must comply with the rule, a description of the steps that the firms must take to comply, and an estimate of the impacts on those firms.

## Background

Each year, employers submit over 250 million W-2 tax forms to the Internal Revenue Service (IRS) and SSA. SSA uses these earnings reports to credit individuals with Social Security benefits. Benefits are credited to an individual's account only if there is a match between the name and Social Security Number (SSN) on the W-2 and the name and SSN in SSA's accounts. Although numerous automated processes are able to resolve many of the discrepancies that are initially encountered, about 4 percent of the annual earnings reports contain information that do not match SSA records and cannot be immediately resolved. ${ }^{1}$

These unmatched reports are placed in SSA's Earnings Suspense File (ESF). Through various procedures, SSA is constantly analyzing the wage reports in the ESF and reinstates records (i.e., credits an individual with a benefit that previously was in the ESF) it is eventually able to validate. As part of its efforts to identify valid records that can be reinstated, SSA periodically contacts employers about individuals on their payrolls. This contact is made through letters that ask employers for their assistance in resolving name and SSN discrepancies between the employers' W-2 filings and SSA records. These "no-match" letters include a list of the SSNs (but no names) in question, and currently are sent only to employers that have at least 10 no-matches and where the no-matches constitute at least 0.5 percent of $\mathrm{W}-2 \mathrm{~s}$ submitted by the employer.

No-matches arise for various reasons, including clerical errors and name changes. The misuse of SSNs by unauthorized aliens is also a factor, although as discussed later, the limited data available to us make it difficult to quantify the percentage of records in the ESF accounted for by unauthorized aliens. That said, the criteria that SSA uses in selecting employers that will receive no-match letters does seem to hone in on those firms who employ unauthorized aliens. This point is demonstrated in Exhibit 1, which shows a

[^0]strong correlation between the number of unauthorized aliens in each State and the number of letters that are sent to each State. ${ }^{2}$

Exhibit 1:

[^1]
## II. Description of Small Entities Affected

This section provides a brief description of the regulated community, with a particular emphasis on the small business entities that will be affected. The Small Business Administration (SBA) estimates there are over 22 million business entities- 10.6 million unincorporated self-employed, 5.5 million incorporated self-employed, and 6 million employer firms. ${ }^{3}$ Although there are over 22 million small businesses in the United States, the safe-harbor procedures will impact only some of those small businesses that are among the 6 million employers.

Section II.A presents the SBA's size standards and employment size classes that are used in the analysis. As discussed below, there is a distinction between employment size classes and the size standards that SBA uses to define small businesses. Section II.B presents the total number of entities affected by the rule, including both small and large businesses. In Section II.C, the affected entities are categorized by employment size classes, whereas Section II.D describes the regulated community using SBA size standards. Finally, Section II.E estimates how the affected businesses are distributed across different industries.

To some extent the rule applies to all employers, because any employer could unknowingly hire unauthorized aliens in the future. This analysis, however, focuses on employers to whom SSA plans to send no-match letters for tax year (TY) 2006. Two key factors determine the likelihood that a given employer will receive a no-match letter and therefore be affected by DHS's no-match rule. The first factor is the criteria that SSA uses to select the employers to whom it will send no-match letters. SSA currently sends no-match letters to those employers who submit more than 10 no-matches, where those no-matches represent more than 0.5 percent of the total number of W-2s the employer filed. This process is illustrated below for an employer with $n \mathrm{~W}-2 \mathrm{~s}$ and $x$ no-matches. SSA has used other criteria in the past and it is possible that these criteria will change in the future. For this analysis, we will assume that SSA will continue to use the current criteria.

No-Match Flow

[^2]The second factor that can influence the possibility that an employer will receive a nomatch letter, and therefore be affected by the rule, is the employer's industry. While SSA's criteria for sending no-match letters is uniform for all employers, historical analyses show that employers in certain industries are significantly more likely to submit enough unmatched W-2s to meet SSA's criteria for receiving a no-match letter. Various analyses of data in the ESF seem to indicate that employers with no-match wage items are concentrated in a few industries. For example, data provided by the Government Accountability Office (GAO) on this topic show that almost 65 percent of the employers in the ESF fall under 11 industry categories out of 83 total possible industries (see Exhibit 7 below). The same data reveal that almost 45 percent of the ESF employers are located in Hotels, Agriculture Production and Services, Eating/Drinking Places, Construction - Special Trade, and Building Construction. These types of statistics are of interest for this analysis since the no-match letter recipients are drawn from the ESF database.

## II.A Small Business Size Standards and Employment Size Classes

This section discusses the employment size classes and SBA's small business size standards that are used in the following sections. These two classification schemes are not the same and are used for different purposes. An SBA size standard is an official definition that determines whether or not any given firm can be classified as a small business. Among other things, a small business classification is used to establish eligibility for Federal loans and Federal contracting opportunities designated for small businesses. SBA maintains a specific size standard for each industry, and these standards can vary considerably across industries. For example, an agricultural firm with annual revenues of $\$ 1$ million would be classified as a large business, whereas a construction company with $\$ 10$ million in revenues would be classified as a small business. In each case, firms within the industry that fall below the designated standard are defined as small.

Employment size classes, in contrast, are categories that are used for analytical purposes. Whereas SBA's size standards divide firms into two categories- "small" and "not small"-numerous employment size classes can be used to categorize firms. For this reason, the classes are useful for evaluating distributions of firms in terms of size. In regulatory studies such as this one, size is often used to gauge the ability of different firms to absorb compliance costs, it being assumed that relatively larger firms will have an easier time absorbing the costs than smaller firms. ${ }^{4}$ For example, a construction company that makes $\$ 10$ million per year will probably have an easier time absorbing a $\$ 1,000$ compliance cost than an agricultural firm that makes $\$ 1$ million per year, even though the former is designated as a small business according to SBA size standards and the latter is not.

[^3]Shown in Exhibit 2 are SBA's general size standards, used to define small entities. ${ }^{5}$ These standards encompass all industries affected by the rule and are used in Section II.D to address the number of small business entities that will be affected.

| SBA Size Standards |  |
| :--- | :--- |
| Industry Group |  |
| Manufacturing | 500 Employees |
| Wholesale Trade | 100 Employees |
| Agriculture | $\$ 750,000$ in revenues |
| Retail Trade | $\$ 6.5$ million |
| General and Heavy Construction <br> (except Dredging) | $\$ 31$ million |
| Dredging | $\$ 18.5$ million |
| Special Trade Contractors | $\$ 13$ million |
| Travel Agencies | $\$ 3.5$ million (commission and other income) |
| Business and Personal Services, Except: | $\$ 6.5$ million |
| Architectural, Engineering, Surveying, <br> and Mapping Services | $\$ 4.5$ million |
| Dry Cleaning and Carpet Cleaning <br> Services | $\$ 4.5$ million |

Source:
http://www.sba.gov/services/contractingopportunities/sizestandardstopics/summarywhatis/index.html. Also, see 13 CFR 121.101(a); 121.201; 121.902 (size standards promulgated for SBA programs and applicable to other agency programs).

As can be seen, most of the size standards are defined in terms of revenue. We do not know the industry or revenue of those entities affected by the rule and therefore cannot directly identify the size of the entities according to the SBA size standards. As discussed below, a statistical approach was used to estimate average revenues in order to tie the analysis to the SBA size standards. See Section II.D, Section III.L, and Appendix L for more details.

We do not know the number of businesses affected by the rule that meet SBA's definition of small, therefore the report uses employment size classes to present and analyze the impacts. These classes are presented in Exhibit 3. Again, employment size classes are not meant to replace SBA's size standards for what constitutes a small business-rather, they are an intuitive measure of firm size based upon available data.

[^4]| Exhibit 3: <br> Employment Size Classes <br> (Number of Employees) |
| :---: |
| $5-9$ |
| $10-19$ |
| $20-49$ |
| $50-99$ |
| $100-499$ |
| $500+$ |

Several different considerations were used to define the size classes. First, the size classes that were selected make it possible to address the wide variety of industries affected by the rule, allow cross-industry comparison, and facilitate the merging of different data sources where necessary. The groups are based upon employment size classes that SBA uses to categorize its data. In particular, there is almost a one-to-one correspondence between the employment size classes used in this analysis and those used to categorize SBA's 2002 revenue data. The analysis draws extensively upon SBA's data, and it was necessary to have class definitions that would make it easy to incorporate those data. Second, a certain level of aggregation was desired, given the relatively small number of entities affected by the rule. In other words, we wanted to make sure that there were enough firms in each category to ensure representativeness for the category and to mitigate any concerns about confidentiality of SSA data. ${ }^{6}$ Finally, employment size classes had to be used instead of revenue size classes. As noted above, we do not have any specific revenue data for the companies affected by the rule. The wage reports that employers submit to SSA do not include information on employer revenues, so the tabulations that SSA provided us do not include such information. In addition, SSA did not believe it could legally provide us with the names and addresses of the companies that will receive no-match letters, thus we could not conduct the necessary research to identify revenues for those firms. On the other hand, the ESF data can be used to tabulate the number of employees for a given employer identification number (EIN). For that reason, classes are shown in terms of employment.

This analysis does not consider firms with 1-4 employees, because it is highly unlikely that such a firm will receive a no-match letter. In order to receive a no-match letter, a company must submit at least eleven W-2s during the year that did not match SSA records. Even with a high labor turnover rate, it is very unlikely that a company with 1-4 employees would submit enough W-2s with discrepancies to warrant a no-match letter. (On the other hand, a firm with 9 employees, all unauthorized, and a 25 -percent turnover rate might submit $11 \mathrm{~W}-2 \mathrm{~s}$ that did not match SSA records.)

[^5]
## II.B Number of Affected Entities

For Tax Year 2006, SSA plans to send no-match letters to 140,835 separate entities, which represents approximately 5.8 percent of the U.S. firms that employ more than four people. ${ }^{7}$ The 5.8 -percent figure should be considered a rough estimate for the following reasons. Entities in the ESF are defined by EINs, so it is possible that some firms could be counted more than once and will actually receive multiple no-match letters. ${ }^{8}$ Also, the estimate of the total number of firms in the U.S. was derived from SBA data on firm size, ${ }^{9}$ which includes most but not all industries. In particular, these data did not include agriculture production. An estimate was added for the number of farms employing more than 10 hired workers to the SBA data. ${ }^{10}$

## II.C Affected Entities by Employment Size Class

There are almost 6 million firms in the United States that hire employees, and only a small number of these businesses are recipients of no-match letters. Exhibit 4 presents the number of affected business entities by employment size class as defined in Section II.A. The distribution of affected entities across size classes (shown in the second column) was derived from tabulations provided by SSA on the number of W-2s that employers submitted. Unlike an average employment level, the annual number of W-2s captures all the employees who were on staff throughout the year and does not take into consideration employee turnover. For this reason, it was necessary to translate the SSA counts by number of W-2s submitted into counts based upon average employment levels. These adjustments were accomplished using annual hire rates from the U.S. Bureau of Labor Statistics. See Appendix A for more information on the calculations that were used.

Average employment levels may fail to adequately reflect high seasonal employment levels in seasonal industries with high turnover rates. For such industries, it is difficult to define an average "annual" employment level, and this should be considered when evaluating information based on these size classes.

[^6]| Number of Affected Entities by Employment Size Class |  |  |
| :--- | ---: | ---: |
| Employment Size <br> Classes <br> (Number of <br> Employees) | Number of Employers <br> Receiving a No-Match <br> Letter ${ }^{11}$ | Total Number of <br> Employers in U.S. ${ }^{12}$ |
| $5-9$ | 4,866 | $1,137,420$ |
| $10-19$ | 24,840 | 645,869 |
| $20-49$ | 46,102 | 407,007 |
| $50-99$ | 23,286 | 132,536 |
| $100-499$ | 33,653 | 86,538 |
| $500+$ | 8,088 | 17,047 |
| Total | 140,835 | $2,426,416$ |

The numbers in the table have been translated into the percentages shown in Exhibit 5. For each size class, the graph presents the number of no-match employers as a percentage of the total employers. The chart shows that less than 1 percent of the employers in the smallest size class will receive no-match letters, whereas over 40 percent of the largest employers will receive one.

Exhibit 5:

[^7]
## II.D Number of Small Business Entities Affected

As demonstrated above in Exhibit 2, SBA's small business size standards vary considerably across the different industries. To estimate the number of small businesses (as defined by SBA size standards) affected by the rule, the number of no-match employers in each industry would need to be known, as well as revenue for firms in most industries. Unfortunately, the SSA was not able to provide industry codes for those EINs that are going to receive no-match letters, nor could they provide firm revenue based on the data in the ESF. Therefore, the number of affected small businesses, as defined by SBA size standards, could not be determined with precision. ${ }^{13}$

However, it is possible to estimate the total number of affected entities (both small and large) that fall under a specific size threshold that coincides with an SBA size standard. Such a threshold could be defined in terms of employment or revenues, but should not be misconstrued as an SBA size standard. Like employment size classes, threshold analysis is simply another tool that can provide insights into how a rule impacts different size categories.

For purposes of analysis, four different size thresholds were developed. Regression analysis was used to estimate a relationship between average revenue and number of employees, which made it possible to define the thresholds in terms of either (see Section III.L for more detail). In other words, the regression equation allowed us to estimate the corresponding number of employees for a given revenue threshold, and vice versa. For example, we estimate that a revenue threshold of $\$ 6.5$ million corresponds to an employment threshold of 60 employees. The ability to move between the revenue and employment thresholds was necessary, because we tabulate of the number of firms under the thresholds based on the number of employees.

The four thresholds used in the analysis are defined in the first two columns in Exhibit 6. To facilitate comparisons with the SBA size standards, each threshold was chosen to coincide with an SBA small business size standard for a major industry segment (see Exhibit 2). The Retail Trade and Business and Personal Services standards are $\$ 6.5$ million or less in revenue; the Wholesale Trade standard is 100 employees or less; the Special Trade Contractors standard is $\$ 13$ million or less in revenue; and the Manufacturing small business standard is less than 500 employees. With the exception of

[^8]Agriculture, these sectors are believed to encompass most of the businesses affected by the rule (see Exhibit 7 for more details). The SBA size standard for Agriculture is $\$ 750,000$ in revenues.

For each threshold, the fourth column in Exhibit 6 shows the estimated number of nomatch employers with fewer employees than the threshold number (second column). The third column shows the total number of employers that fall beneath the size threshold. Neither of the tabulations includes firms with 1-4 employees, because those firms are highly unlikely to be affected by the rule.

| No-Match Employers Smaller than Specified Size Threshold |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Size Threshold |  |  | No-Match Employers |  |  |
| Revenues ${ }^{14}$ <br> (\$ millions) | Number of <br> Employees | Total Firms ${ }^{15}$ |  | Number $^{15}$ | \% of Total No- <br> Matches |
| 6.5 | 60 | $2,216,803$ | \% of Total Firms <br> under Size <br> Threshold |  |  |
| 11.7 | 100 | $2,322,831$ | 99,465 | $57 \%$ | $3.6 \%$ |
| 13 | 111 | $2,325,427$ | 100,103 | $71 \%$ | $70 \%$ |
| 58.6 | 500 | $2,409,369$ | 132,747 | $94 \%$ | $4.3 \%$ |

Based upon the data in the fourth column in Exhibit 6, we estimate there are 80,465 employers who will receive a no-match letter and who employ less than 60 people (and who have corresponding revenues of less than $\$ 6.5$ million). This figure accounts for 57 percent of all the employers who will receive no-match letters; it also represents less than 4 percent of the total number of employers in the United States who employ less than 60 people.

The last column in the table shows that the number of businesses affected by the rule constitutes between 3.6 percent and 5.5 percent of the total number of firms under these size thresholds.

## II.E Affected Entities by Industry

Although it was not possible to tabulate the number of affected firms by industry and size class due to the previously discussed data limitations, several sources provide clues regarding how the no-match letters are likely to be distributed across different industries.

[^9]In October 2004, SSA's Office of the Inspector General (OIG) released an audit of the top 100 employers with the most wage items in the ESF for tax years 1997 through 2001. ${ }^{16}$ The analysis found that 43 of the employers were in the service industry, 32 employers were in the restaurant industry, and 20 employers were in agriculture. Unfortunately, the usefulness of the results is somewhat limited because these 100 employers were not randomly selected and, therefore, are unlikely to be a statistically valid representation of the 140,835 firms that are going to receive a no-match letter. Also, the industry definitions are somewhat arbitrary and are difficult to use in conjunction with other data sources. For example, SSA personnel informed us that the construction sector was included under services and that the assignment of employers to industries was based on personal observation, since the ESF data did not include U.S. Standard Industrial Classification (SIC) codes or North American Industry Classification System (NAICS) codes. ${ }^{17}$

## GAO Report

In February 2005, GAO released an extensive analysis of the wage items in the ESF, covering tax years 1985 to 2000 and 4.3 million employers. ${ }^{18}$ Part of the analysis examined the extent to which different industries are represented in the ESF. SSA was able to provide GAO with industry identification codes ${ }^{19}$ for 1.8 million employers out of the 4.3 million employers with wage items in the ESF over the study period. Based upon these 1.8 million employers, the percentage of employers with wage items in the ESF was tabulated for 83 different industries. The report presents the results for five of these industries, with the remaining 78 industries collapsed into an "All Others" category. Upon request, GAO was able to provide us with more detailed tabulations based upon these same 1.8 million employers. ${ }^{20}$ These tabulations include estimates for 25 industries and an "All Others" category. ${ }^{21}$ Together, the 25 industries account for approximately 87 percent of the 1.8 million employers with industry codes.

The distribution of these 25 industries does not necessarily reflect the distribution of industries that will receive no-match letters. Because SSA only sends letters to employers who have more than 10 no-matches, the extent to which an industry is concentrated in the smallest employment size classes will affect the probability that it receives a no-match letter. For example, according to County Business Patterns data for 2005, only 36 percent of eating and drinking establishments employ 1-4 employees,

[^10]whereas 63 percent of special trade contractors employ 1-4 employees. ${ }^{22}$ All things equal, this difference in industry distribution across size classes means that an eating and drinking establishment will be more likely than a special trade contractor to receive a nomatch letter.

Differences in labor turnover rates could also change the industry distribution relative to what is seen in the ESF. The turnover rate determines the number of unique $\mathrm{W}-2 \mathrm{~s}$ that are submitted by employers, which indirectly affects whether an employer will receive a letter, since employers must submit more than 10 different $\mathrm{W}-2 \mathrm{~s}$ in order to be eligible to receive a letter. This issue is particularly germane for small employers who typically have 5-9 employees on staff at any given time. A sufficient turnover rate for one of these employers can mean that it will submit more than enough $\mathrm{W}-2 \mathrm{~s}$ to place it in the pool of employers who will potentially receive a no-match letter.

To account for these issues, adjustments were made to GAO's industry percentages using BLS data on labor turnover rates and County Business Patterns data on class size. Details on the calculations used to make the adjustments are provided in Appendix E. The results are presented below in Exhibit 7. The third column in the table presents the original figures tabulated by GAO, and the fourth column shows the percentages after they have been adjusted for differences in size class and labor turnover. Note that the percentages in the last column reflect what is believed to be the distribution of industries across the pool of employers who could potentially receive a no-match letter. It does not account for possible industry differences in the percentage of total W-2s that are in the ESF. Such differences, if they exist, could affect the actual distribution of no-match letters across industry sectors.

As can be seen by comparing columns three and four in Exhibit 7, the adjustments reduced the industry percentages for most sectors in the table. The exceptions are in industries with high turnover rates, mostly retail and service establishments, and for the most part the no-match percentage increases slightly. The no-match percentage for Eating and Drinking Places increases by 10 percentage points after adjusting for turnover and size. This is consistent with the high rate of employee turnover in that industry as well as the distribution of size classes.

[^11]| Exhibit 7: Estimated Distribution of No-Match Letters Across Industry Sectors |  |  |  |
| :--- | :---: | :---: | :---: |
| Industry | SIC | Industry Distribution |  |
|  |  | ESF | No-Match |
| Agriculture Production-Crops | 01 | $6.7 \%$ | $4.5 \%$ |
| Eating and Drinking Places | 58 | $17.2 \%$ | $27.5 \%$ |
| Construction-Special Trade | 17 | $10.1 \%$ | $7.6 \%$ |
| Business Services | 73 | $5.1 \%$ | $4.3 \%$ |
| Health Services | 80 | $4.0 \%$ | $3.8 \%$ |
| Food Stores | 54 | $3.5 \%$ | $3.7 \%$ |
| Agriculture Services | 07 | $3.4 \%$ | $1.8 \%$ |
| Miscellaneous Retail | 59 | $3.4 \%$ | $2.6 \%$ |
| Bldg. Construction Gen. Contractor, OP Bldr* | 15 | $3.4 \%$ | $1.9 \%$ |
| Personal Services** | 72 | $3.3 \%$ | $1.9 \%$ |
| Auto Repair, Services, Parking | 75 | $2.9 \%$ | $1.6 \%$ |
| Auto Dealers, Gas Stations | 55 | $2.7 \%$ | $3.3 \%$ |
| Real Estate | 65 | $2.7 \%$ | $0.9 \%$ |
| Durable Goods, Wholesale | 50 | $2.3 \%$ | $2.1 \%$ |
| Social Services | 83 | $2.1 \%$ | $2.5 \%$ |
| Engineering, Architecture, Research ...** | 87 | $1.8 \%$ | $1.1 \%$ |
| Non durable Goods, Wholesale | 51 | $1.8 \%$ | $1.6 \%$ |
| Hotels, Other Lodging Places | 70 | $1.7 \%$ | $2.5 \%$ |
| Private Households | 88 | $1.7 \%$ | $1.5 \%$ |
| Motor Freight Transp. and Warehouse | 42 | $1.7 \%$ | $1.4 \%$ |
| Amusement and Recreation Services | 79 | $1.5 \%$ | $1.5 \%$ |
| Home Furniture \& Equipment Stores | 57 | $1.2 \%$ | $1.1 \%$ |
| Apparel and Other Finished Products | 23 | $1.1 \%$ | $1.3 \%$ |
| Apparel and Accessory Stores | $1.1 \%$ | $1.3 \%$ |  |
| Legal Services | $1.0 \%$ | $0.5 \%$ |  |
| OTHER |  | $12.5 \%$ | $15.9 \%$ |
|  |  |  |  |

* "OP Bldr" means Operative Builder.
** Personal Services include laundry, carpet cleaning, photo studios, beauty shops, shoe repair, funeral services, tax and other miscellaneous personal services.
*** Full listing also includes Engineering, Architecture, Research, Management-Related Services.
The following two exhibits provide additional information for the top three industries listed above. Exhibit 8 illustrates the distribution of establishments by number of employees. The percentage of firms with 1-4 employees explains why most of the industry no-match rates decreased when adjusted for firm size. For example, 78.3 percent of agriculture establishments employ 1-4 people, and thus are highly unlikely to submit the $10 \mathrm{~W}-2 \mathrm{~s}$ needed to qualify for a no-match letter. Furthermore, the percentage of firms in all industries except Eating and Drinking Establishments decreases as the size class increases. Since the percentage of no-match employers increases in each size class (See Exhibit 5), the downward-sloping trend explains why no-match rates decrease when adjusted for firm size. This result also explains the increase in the adjusted no-match rate
for Eating and Drinking Establishments, since the distribution of this industry by size class does not decrease until the number of employees exceeds 50 .

| Exhibit 8: Distribution of Establishments Across Employment Size Classes ${ }^{23}$Selected Industries: 2005 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Selected | Employment Size Class |  |  |  |  |  |  |
| Industries | 1-4 | 5-9 | 10-19 | 20-49 | 50-99 | 100-499 | 500+ |
| U.S. Total NonAgriculture | 54.9\% | 18.8\% | 12.5\% | 8.5\% | 2.9\% | 2.1\% | 0.2\% |
| Special Trade Contractors | 63.5\% | 17.2\% | 10.3\% | 6.2\% | 1.8\% | 0.9\% | 0.1\% |
| Eating and Drinking Establishments | 35.7\% | 16.9\% | 19.0\% | 20.9\% | 6.1\% | 1.4\% | 0.0\% |
| Agriculture | 78.3\% | 16.9\% | 2.4\% | 1.2\% | 1.2\% | 0.0\% | 0.0\% |

Exhibit 9 illustrates the distribution of total employment by number of employees and provides insight into the number of employees affected by the rule. Because of the structure of the size classes, the decrease in number of firms as the size class increases is offset by the increase in the number of employees of each firm. Two observations are worth noting. The first is that the distribution of total employment for the Special Trades industry and the Eating and Drinking Establishments in the largest size classes is lower than the total non-agricultural employment. This implies that, while the rule may affect a greater percentage of employees in these two industries in the smaller size classes, most employees affected by the rule in the largest size classes are in other industries. The second observation is that the total agricultural employment is concentrated in the smallest size categories, those least likely to be affected by the rule. Thus firms in the agriculture industry, especially those designated as small businesses, are likely to be too small to be affected by the rule.

| Exhibit 9: Distribution of Employment Across Employment Size Classes ${ }^{24}$ |  |  |  |  |  |  |  |  |

[^12]
## III. Compliance Requirements ${ }^{25}$

This section provides an analysis of the compliance requirements. Sections III.A through III.K develop estimates of the compliance costs associated with the no-match rule. Section III.L reports average revenues per firm, which are compared with cost estimates in Section III.M.

## Primary Assumptions

Estimation of the direct compliance costs rely upon the following two assumptions. First, it is assumed that none of the affected entities were previously using any procedures to address SSA no-match letters. That means the full cost of the safe-harbor procedures will be included in the computations rather than a marginal increase in the cost of the verification procedure. It is likely that this assumption results in significantly overestimating the administrative costs of following the safe-harbor procedures. For example, in an analysis of 78 employers ( 50 large, 28 small) who had the highest percentage of W-2 records that did not match SSA records, the IRS found that these 78 employers had processes in place for re-soliciting and attempting to correct employee information based upon the receipt of a no-match letter. ${ }^{26}$ The cost of adopting the safeharbor procedures is likely to be significantly lower for such employers who already have systems in place for responding to no-match letters.

Second, it will be assumed that 100 percent of the firms that receive no-match letters will choose to follow the safe-harbor procedures. In conjunction with the first assumption, this means that the change in the rate of compliance is also 100 percent. This assumption also results in over-stating the average compliance costs that will be incurred by industry.

## Sources

Several sources helped us identify the types of costs likely to be incurred as a result of the rule, including: comments that were submitted on the proposed rule; court orders, declarations and other supporting materials entered in Case Number 3:07-cv-04472-CRB, United States District Court, Northern District of California; a meeting with SBA personnel; and the experience of personnel who previously worked in a Human Resources office.

[^13]Conversations with numerous individuals helped us quantify some of the variables used in the cost analysis. We talked to a self-employed lawyer who serves small businesses, an accountant who works part-time for a small firm, a small family farmer, and a payroll firm that processes payroll and taxes for a larger number of small businesses.

Several government reports and studies (as well as congressional testimonies) were reviewed for pertinent information. Most of these were published by the SSA, the IRS or the GAO. Information obtained from the Pew Hispanic Center website and two Westat reports were also useful.

## Definition of Costs Considered

The analysis includes cost estimates for the following:

- Labor for Human Resources (HR) personnel to administer the safe-harbor procedures.
- Training for HR personnel.
- Accounting services.
- Legal services.
- Lost productivity.
- Turnover of authorized employees.
- Miscellaneous (phone, postage, printing).

Human Resources labor costs are based on appropriate occupational wage rates and on estimates of the amount of time it will take to conduct record checks, write form letters and send them, meet with employees, and provide employees with other assistance to help them resolve their no-match discrepancies.

Some comments regarding the rule suggested that special HR tracking systems would also be needed to track seasonal employees no longer with the company at the time the no-match letter is received. The rationale for such a tracking system would be to mitigate an employer's risk by ensuring that the employer can identify, and appropriately examine the work authorization documents for, returning job applicants who were previously listed on a no-match letter. Employers in seasonal industries who adopt such a policy would likely keep a copy of their no-match letters and compare the SSNs on new employment eligibility forms with those SSNs listed in the letters. This routine would likely become embedded in the normal processing of new job applicants. The no-match rule does not address this scenario, and seasonal employers who hire returning workers would have had sufficient reason under the pre-existing regulations to compare past nomatch letters against the identity information provided by all new and returning hires. Therefore, the cost of any such system is attributable to the INA and to the prior regulation, not to the no-match rule.

Other comments suggested that firms will need to purchase or develop special HR software in order to comply with the no-match rule. It needs to be remembered that all of the no-match letter recipients employ at least 10 people in a given tax year, and must submit annual taxes for those individuals. Given the complexity associated with such tax
submissions, it is assumed that all the firms either utilize the services of an accountant or complete their tax reports with electronic software. For this reason, most of the no-match employees will likely be in some type of electronic database at the time the no-match letter is received. We do include costs for extracting that information. Employers are also required by law to maintain a copy of each employee's I-9 form for at least 3 years after the employee has separated. Therefore, each employer should already have a system for tracking relevant employee information over time.

Termination and replacement costs for unauthorized workers also are not included in the analysis. Such costs include expenses for the administrative functions related to the termination, costs of finding an appropriate replacement (advertising, interviewing applicants, background checks, etc.), and lost productivity. The termination and replacement of unauthorized employees will impose a burden on employers, but the INA expressly prohibits employers from knowingly hiring or knowingly continuing to employ an alien who is not authorized to work in the United States. Accordingly, these costs that result from employers' knowledge of their workers' illegal status are attributable to the $\mathrm{INA}^{27}$ and to other actions setting out DHS's definition of "knowledge," not to the nomatch rule and its provision of a safe harbor. Similarly, any costs incurred by seasonal employers who face difficulties in hiring new employees in the place of returning workers previously listed on SSA no-match letters are attributable to the INA's bar to knowingly hiring workers who are not authorized to work in the United States.

As the no-match rule and safe-harbor procedures are publicized in the mainstream media, employers of potentially unauthorized workers may begin to consider their options and how they would respond to the receipt of a no-match letter, even if they do not receive a no-match letter based on their filings for the 2007 tax year. Because the no-match rule's safe-harbor procedures only come into play when an employer actually receives a nomatch letter, any costs associated with such an announcement effect likely do not constitute "compliance" costs of the no-match rule, even under the expansive use of that term we make for purposes of this analysis. Furthermore, the only costs that an employer might incur in advance of receiving an actual no-match letter are certain human resources training and system development costs laid out in more detail below, and as that discussion shows, these costs are not significant. We also note that the employers most likely to take such steps in anticipation of future no-match letters are those that have a consistent track record of receiving such letters, or that are in economic sectors such as agriculture, construction, hospitality, and other services where many firms have been receiving no-match letters for years. Such "announcement effect" investment in the near term may reduce the total expense to small employers who eventually follow the safeharbor procedures once no-match letters arrive, since the firms will be able to train their staff at their leisure-e.g. through regularly scheduled seminars-rather than through consulting or other potentially costlier arrangements to which employers might resort when faced with the safe-harbor's deadlines that begin to run once no-match letters actually arrive. Thus, not only do we conclude that any costs of this "announcement effect" will be insignificant, but we also believe that the "announcement effect" will

[^14]likely result in savings to the total costs employers face should they ultimately receive a no-match letter and decide to adopt the safe-harbor procedures in DHS's no-match rule.

## III.A Employee Separations Prior to a Firm's Receipt of a No-Match Letter

A significant percentage of the costs of implementing the rule's safe-harbor procedures results from employees who are currently on staff and who are the subject of a no-match letter. As explained in more detail below, employees who are no longer with the firm will result in lower compliance costs in comparison to employees who still work for the company. For example, current employees may need to meet with HR staff and/or could need to have corrected W-2s submitted to SSA; neither of these costs would apply to an individual listed on a no-match letter who had already separated from the firm. For this reason, it was necessary to estimate the number of employees with mismatches who will have left the company when it receives the no-match letter. Companies that receive nomatch letters will need to match the listed SSNs with their current employees; other than this administrative cost, separated employees are not included in any of the other variable cost calculations.

As part of its Job Openings and Labor Turnover Survey (JOLTS) program, BLS publishes monthly and annual employee separation ${ }^{28}$ rates for non-agricultural industries. In Appendix C, these rates are combined with information on the distribution of affected employers across industries; the result is a weighted average separation rate of 57.1 percent that is specific for this analysis.

The weighted average separation rate was multiplied by the number of no-match employees in each size class to estimate the number of workers with mismatches who will have separated from their employers before the employers receive their no-match letters. ${ }^{29}$ The separations were then subtracted from the total number of workers with mismatches to estimate the current number of workers with mismatches that remain on staff when the firms receive their letters. These estimates are provided below.

The results of these calculations are shown in Exhibit 10. The second column in the exhibit shows the total number of employees listed on the no-match letters that employers will receive. The figures in the third column (the estimated number of employee separations) are equal to 57.1 percent times the numbers in the second column (total number of no-match employees). The numbers in the fourth column are simply the numbers in the second column minus the figures in the third column.

[^15]| Number of Employees on No-Match Letters Who Separate Prior to Firms' Receiving Letters |  |  |  |
| :---: | :---: | :---: | :---: |
| Employment Size <br> Class | Total Number of <br> No-Match <br> Employees | Number of No-Match <br> Employee Separations <br> Prior to Firm's Receipt <br> of No-Match Letter | Number of Current No- |
| Match Employees on <br> Staff When Firm <br> Receives No-Match <br> Letter $^{32}$ |  |  |  |
| $5-9$ | 55,891 | 31,907 | 23,984 |
| $10-19$ | 353,465 | 201,787 | 151,678 |
| $20-49$ | $1,111,563$ | 634,572 | 476,991 |
| $50-99$ | 782,117 | 446,497 | 335,620 |
| $100-499$ | $4,984,098$ | $2,845,333$ | $2,138,764$ |
| $500+$ | $1,876,525$ | $1,071,275$ | 805,250 |
| Total | $9,163,658$ | $5,231,371$ | $3,932,287$ |

## III.B Number of Authorized and Unauthorized Employees Affected

To compute the costs of complying with the no-match rule, an estimate must be made about the number of authorized and unauthorized workers who are on the no-match list that employers receive. Unauthorized workers are unlikely to attempt to reconcile their information with SSA records and will probably quit or be terminated at the end of the 93 -day period. As a result, we assume that unauthorized workers will not give rise either to the same sort of productivity costs (e.g., taking off work to visit an SSA office) or administrative costs (e.g., sending in a corrected W-2 form) associated with authorized workers. Of course, the employer will incur termination and/or replacements costs when an unauthorized employee is terminated or voluntarily departs; as discussed above, however, those costs are attributable to the INA and not to the no-match rule (see footnote number 27 and corresponding discussion).

Numerous sources were reviewed for information that could be used to develop a point estimate of the number of unauthorized workers that will be affected by the no-match letters. These sources are reviewed in Appendix F. It was not possible to draw any definitive conclusions from these materials and we were unable to find a point estimate upon which to base the cost estimates. While some industry representatives have publicly stated that 70 percent or more of their workforce is unauthorized, we assume such figures, if accurate in certain cases, are not representative of all businesses that receive no-match letters. Given the large amount of uncertainty about the percentage of workers listed in no-match letters who are unauthorized to work, the cost estimates are developed for the following five category assumptions about the percentage of the nomatch employees who are unauthorized:

[^16]| Exhibit 11: <br> Categories Representing the <br> Percentage of No-Match Employees <br> Considered to Be Unauthorized |
| :---: |
| $10 \%$ |
| $20 \%$ |
| $40 \%$ |
| $60 \%$ |
| $80 \%$ |

These percentages were used in conjunction with the number of no-match employees currently on staff at the firms who received the letters (see Exhibit 10 above) to estimate the number of authorized and unauthorized employees who will be affected by the rule (shown in Exhibits 12 and 13). The figures in Exhibit 12 are derived by multiplying the numbers in the last column in Exhibit 10 (the number of no-match employees on staff when the firms receive their letters) by the percentages at the top of each column in Exhibit 12. For example, in Exhibit 10 it is estimated there will be 23,984 no-match employees on staff at firms in the 5-9 employee size class when those firms receive their no-match letters; multiplying 23,984 by 10 percent yields 2,398 : the estimated number of unauthorized employees for the 5-9 employment size class shown under the 10-percent assumption in Exhibit 12.

| Exhibit 12:Estimated Number of Unauthorized No-Match Employees by Size Class ${ }^{33}$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Employment Size Class | Percentage of No-Match Employees Assumed to Be Unauthorized |  |  |  |  |
|  | 10\% | 20\% | 40\% | 60\% | 80\% |
| 5-9 | 2,398 | 4,797 | 9,594 | 14,390 | 19,187 |
| 10-19 | 15,168 | 30,336 | 60,671 | 91,007 | 121,342 |
| 20-49 | 47,699 | 95,398 | 190,797 | 286,195 | 381,593 |
| 50-99 | 33,562 | 67,124 | 134,248 | 201,372 | 268,496 |
| 100-499 | 213,876 | 427,753 | 855,506 | 1,283,258 | 1,711,011 |
| 500+ | 80,525 | 161,050 | 322,100 | 483,150 | 644,200 |
| Total | 393,229 | 786,457 | 1,572,915 | 2,359,372 | 3,145,830 |

The figures in Exhibit 13 are derived in a similar fashion. However, since the table refers to authorized employees instead of unauthorized employees, the numbers in the last column in Exhibit 10 (the number of no-match employees on staff when the firms receive their letters) are multiplied by one minus the percentages at the top of each column in Exhibit 12. For example, in the second column first row, 21,585 is 90 percent of 23,984. Another way to calculate the figure is to subtract the corresponding estimate of unauthorized employees in Exhibit 12 from the total number of current employees in Exhibit 10. For example, 21,585 also equals 23,984 minus 2,398.

[^17]| Exhibit 13:Estimated Number of Authorized No-Match Employees by Size Class ${ }^{34}$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Percentage of No-Match Employees Assumed to Be Authorized |  |  |  |  |
| Employment Size Class | $\mathbf{9 0 \%}$ (10\% Unauthorized) | $\mathbf{8 0 \%}$ $(20 \%$ Unauthorized) | $\mathbf{6 0 \%}$ $(40 \%$ Unauthorized) | $40 \%$ (60\% Unauthorized) | $\mathbf{2 0 \%}$ (80\% Unauthorized) |
| 5-9 | 21,585 | 19,187 | 14,390 | 9,594 | 4,797 |
| 10-19 | 136,510 | 121,342 | 91,007 | 60,671 | 30,336 |
| 20-49 | 429,292 | 381,593 | 286,195 | 190,797 | 95,398 |
| 50-99 | 302,058 | 268,496 | 201,372 | 134,248 | 67,124 |
| 100-499 | 1,924,888 | 1,711,011 | 1,283,258 | 855,506 | 427,753 |
| 500+ | 724,725 | 644,200 | 483,150 | 322,100 | 161,050 |
| Total | 3,539,059 | 3,145,830 | 2,359,372 | 1,572,915 | 786,457 |

## III.C Wage Rates

Hourly wage rates were needed to compute the opportunity costs of individuals who would be administering the safe-harbor procedures. Wage rates were also needed for the employees referred to in the no-match letters and who had to take time off work to correct their SSA records.

In addition to the employee, it was assumed that five occupations will be responsible for carrying out the safe-harbor process:

- Lawyer
- Accountant
- Compensation and Benefits Manager
- Compensation, Benefits, or Employment Specialist
- Human Resources Assistant

For each of these occupations, average hourly wage estimates by State were obtained from the U.S. Bureau of Labor Statistics (BLS). ${ }^{35}$ Average wages were used instead of median wages to be consistent with the other cost and revenue estimates that are computed on an average basis. A weighted average of these State wages was then developed by using as weights the percentage of no-match letters to be sent to each State for Tax Year (TY) 2006. ${ }^{36}$ It should be noted that the employer address on a W-2 is occasionally a different State than where the employee actually works. This can happen

[^18]for example when the payroll processing unit is located at a different site than the firm's other establishments.

These weighted averages reflect salary information but do not include benefits, which need to be included to reflect the true opportunity cost of the employees' time. A multiplier of 1.43 was used to put the weighted average wages on a loaded basis. The multiplier was derived from June 2007 data on total compensation per hour and average hourly wages, recently released by BLS in its Employer Costs for Employee Compensation ${ }^{37}$ report. According to the report, civilian workers in June 2007 received an average hourly wage of $\$ 19.38$ per hour and an additional $\$ 8.37$ per hour for benefits. Benefits included retirement and savings, Social Security, Medicare, unemployment insurance, workers' compensation, paid leave (vacations, holidays, sick leave, and other leave), and other insurance benefits (life, health, and disability). Together, the combined wage and benefit figures represent a total compensation of $\$ 27.75$ per hour. Dividing this total compensation by the $\$ 19.38$ wage rate yields the multiplier of 1.43 .

The wages are presented below in Exhibit 14. Note that the loaded hourly wages in column 3 are equal to the product of 1.43 and the corresponding weighted average hourly wages in column 2. For example: in the first row, $78.75=55 \mathrm{X} 1.43$.

| Exhibit 14: |  |  |
| :--- | :---: | :---: |
| Estimated Occupational Wage Rates (\$) |  |  |
| Occupation | Weighted <br> Average Hourly <br> Wage | Loaded Hourly <br> Wage |
| Lawyer | 55 | 78.75 |
| Accountant | 29 | 41.52 |
| Compensation \& Benefits Manager | 40 | 57.28 |
| Compensation/Benefits/Employment Specialist | 26 | 37.23 |
| Human Resources Assistant | 17 | 24.34 |

In addition to these occupational wage rates, it was necessary to capture the value of lost time for any employee listed on a no-match letter. Since employees listed on no-match letters span the gamut of occupations, an average labor rate across all occupations was used for this purpose. Again, a weighted average wage rate was developed. For each State, a single average wage representing all occupations was obtained from the same BLS source listed below; these wages were then weighted by the percentage of no-match letters to be sent to each State for TY 2006. The sum of the weighted wages was $\$ 19.26$ per hour, the weighted average wage rate used in the analysis. The corresponding loaded rate is $\$ 27.58$.

[^19]
## III.D Legal Costs

For various reasons, firms may seek legal counsel if they receive a no-match letter. To estimate the corresponding costs incurred by business, information and assumptions were developed for the number of legal hours that will be purchased, ${ }^{38}$ the average cost per hour, and the number of firms that will seek advice.

In terms of the number of legal hours that a firm is expected to buy, lawyers who are familiar with the issue will take less time, whereas other lawyers who are not familiar with the issue will spend more time. We believe that legal counsel would be retained by an employer primarily to help the employer better understand the voluntary safe-harbor procedures outlined in the rulemaking and to advise if the procedures an employer used to deal with a no-match letter meets the standard contained in the no-match rule. If an employer receives a no-match letter in multiple years, we believe that the employer would be less likely to need the advice of legal counsel once an employer has already consulted with an attorney and put into place measures to voluntary comply with the safeharbor rulemaking. Consequently, we believe the need for legal counsel, to the extent there may be a need, to be a "start-up" cost. We estimate that counsel will spend 8 to 40 hours and providing guidance. For purpose of analysis, we assume an average of 24 hours or 3 work days.

In terms of the hourly cost that will be incurred, some firms will have lawyers on staff whereas other firms will have to hire the services of a legal firm. For purposes of this analysis, the costs of these two services (i.e., in-house versus outsourced) should be fairly similar since the opportunity cost of the in-house lawyer should approximate the rental fee of the outsourced lawyer. Shown in Exhibit 14 above, the hourly cost for legal services was estimated to be $\$ 78.75$.

Not all firms will seek legal advice, and it was therefore necessary to make an assumption about the percentage of firms that will pursue this option. Lacking any tangible data on the topic, we assumed that 50 percent of the firms that receive no-match letters will seek legal counsel. ${ }^{39}$

Based upon these assumptions, the average legal cost per firm was estimated to be $\$ 945$ ( $\$ 78.75$ per hour X 24 hours X 0.5).

## III.E Accounting Costs

Firms will incur some accounting costs associated with submitting corrected $\mathrm{W}-2 \mathrm{~s}$ to SSA. Employers will submit such corrections only for authorized employees who are able to resolve their no-matches. To estimate the corresponding costs incurred by business, information and assumptions were developed for the number of hours required

[^20]by an accountant. These hours were multiplied by the average cost per hour for an accountant ( $\$ 41.52$ as shown in Exhibit 14 above) to generate the cost estimates.

It is assumed that for 98 percent of the current authorized employees an accountant will spend one-quarter hour completing a W-2c (a form representing a corrected W-2). Since only name or SSN changes will be submitted, the amount of time required should be minimal: in other words, no changes to the payroll data will be involved. A W-2c will not need to be completed for unauthorized employees or authorized employees who are terminated at the end of the 93-day safe-harbor period. As discussed in Section III.J, it is assumed that 2 percent of the current authorized employees listed on the no-match letter will be terminated.

It is also assumed that the W-2cs along with a single W-3c (a transmittal form for corrected wage and tax statements) will be submitted in batch after all of the no-matches have been resolved. For each firm that receives a no-match letter, it is estimated that an accountant will spend one-half hour filling out the $\mathrm{W}-3 \mathrm{c}$ and sending the batch to SSA.

The average accounting costs per firm are presented by size class in Exhibit 15. The costs depend upon the number of authorized and unauthorized employees assumed to be on staff when the firm receives the no-match letter. Therefore, the table depicts different cost estimates for the different assumptions regarding this matter. For each given size class, note that the costs decrease as the percentage of no-match employees who are assumed to be unauthorized increases. This result is because fewer W-2 corrections are needed as the number of authorized employees decreases.

| Exhibit 15: ${ }^{40}$Average Accounting Costs Per Firm by Employment Size Class (\$) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Employment Size Class | Percentage of Current No-Match Employees Assumed to Be Unauthorized |  |  |  |  |
|  | 10\% | 20\% | 40\% | 60\% | 80\% |
| 5-9 | 66 | 61 | 51 | 41 | 31 |
| 10-19 | 77 | 70 | 58 | 46 | 33 |
| 20-49 | 115 | 105 | 84 | 63 | 42 |
| 50-99 | 153 | 138 | 109 | 79 | 50 |
| 100-499 | 603 | 538 | 409 | 279 | 150 |
| 500+ | 932 | 831 | 628 | 426 | 223 |

In order to show a sample calculation, we are going to show how the $\$ 66$ in the 5-9 "Employment Size Class" row in Exhibit 15 was derived:

Completion of the W-2cs $=0.25$ hour X \$41.52 X 0.98 X 21,585 employees ${ }^{41}=\$ 219,571$ Completion of the $\mathrm{W}-3 \mathrm{cs}=0.5$ hour $\mathrm{X} \$ 41.52 \mathrm{X} 4,866$ employers ${ }^{42}=\$ 101,018$

[^21]Total cost of W-2cs and W-3cs $=\$ 219,571+\$ 101,018=\$ 320,589$
Total cost of W-2cs and W-3cs on a per employer basis $=\$ 320,589 / 4,866$ employers $=$ \$66

## III.F HR Labor Costs to Administer Safe-Harbor

## Assumptions about the Resolution of No-Matches

Two major assumptions are made about how no-matches are resolved through the safeharbor process. The first assumption concerns the extent to which errors are detected and corrected at different stages in the process. The assumption is necessary since the administrative burden varies by stage and the corresponding costs depend upon the number of employees going through each stage. For authorized employees who are on the no-match list, there are three places in the process where an error could be detected and corrected. The first place occurs during the firm's initial review of the employee's records, which determines if the no-match is due to a clerical error. The second place in the process occurs when the employee is able to identify an error in the employer's records (e.g., a name change due to a marriage or divorce). The third and final place occurs when employees have to resolve their no-matches through interaction with the SSA and perhaps other government agencies. In the absence of any data on the subject, it is assumed that one-third of the authorized employee no-matches will be identified and corrected during each of the first two stages. The remaining one-third of authorized employees are assumed to go through the steps in the third stage, which will help resolve most of those no-matches; however, as specified in Section III.J, it is assumed that 2 percent of the authorized employees will not be able to resolve their no-matches and will be terminated at the end of the 93-day period. ${ }^{43}$ In regard to unauthorized workers, it is assumed that they will go through the first two stages, but will not take any actions in the third stage such as contacting SSA.

The second assumption concerns the possible termination of authorized employees. Kenneth Apfel, the former Commissioner of SSA between 1997 and 2001, has expressed concern "that there will be many legally authorized workers who cannot resolve a mismatched earnings report by any arbitrary deadline." ${ }^{44}$ However, it needs to be realized that employers incur a cost when they terminate an employee. It takes time and money (e.g., advertising expenses) to find a replacement and the new employee may have to be trained to do the job. If they are available, employers will pursue measures that are less costly than termination. Because it is in their financial interests, we assume that employers will be proactive and will choose to help their employees navigate the process of resolving their no-matches. Such activities will help expedite employees through the process and will help eliminate unnecessary terminations. As discussed in Section III.J, the cost estimates are based on the assumption that 2 percent of the authorized employees

[^22]could be terminated. All unauthorized employees are assumed to separate from the employer at the end of the 93-day period.

## Form Letters

For each firm, it is assumed that staff will write several different form letters that the firm will use to communicate with affected employees and which employees can use to communicate with various government agencies. Examples of such letters can already be found on the Internet. ${ }^{45}$ It is assumed that a Compensation and Benefits Manager (or equivalent) will spend one-quarter hour in this endeavor and that a Compensation/Benefits/Employment Specialist (or equivalent) will spend one-half hour. This cost amounts to $\$ 32.93$ per firm and does not depend upon the number of authorized or unauthorized employees at the company. ${ }^{46}$

## Identification of Employees Listed on the No-Match Letter

Each no-match letter includes a list of the questionable SSNs (but not the corresponding names) that were submitted by the employer on the $\mathrm{W}-2 \mathrm{~s}$. When an employer receives the letter, one of the first things it will need to do is identify the employees on the list and determine whether they are still working for the company. To accomplish this screening, it is assumed that each employer will generate a list of current employees that contains at a minimum SSN and employee name, and which is sorted by SSN. Some firms will utilize in-house resources to produce the list (e.g., by having a payroll clerk query a database), whereas other firms will need to procure the list from their accountant or their payroll processing company. Once the list of current employees is generated, it is assumed that an HR Assistant (or equivalent) will then spend one-quarter hour comparing the SSNs on the no-match letter with the SSNs on the list of current employees. ${ }^{47}$ The cost of generating or procuring the report of current employees is assumed to be $\$ 175$. The cost of the HR Assistant's time is $\$ 6.09$ (24.34 X 0.25). The total cost for the activity is estimated to be $\$ 181.09$.

## Review of Employee Records

The identification of the current employees on the no-match letter will be followed by a review of each employee's file to check if any clerical errors were made on his/her W-2. It is assumed that a Compensation/Benefits/Employment Specialist (or equivalent) will spend one-quarter hour per current no-match employee to identify the no-match employees and conduct the review. These costs depend upon the number of no-match employees who will have separated from the company before it receives the no-match letter; in other words, the costs are computed for each remaining employee regardless of

[^23]whether the employee is authorized or unauthorized. See Appendix I for more information on these costs.

## Initial Letter to Employee

If no clerical errors are found during the initial record check, it is assumed that the employer will make a written request to the employee, asking him/her to verify that the company has the correct name and SSN. We assume that an HR Assistant (or equivalent) will be responsible for filling out a form letter, printing it, and mailing it to the employee. It is estimated that it will take one-tenth of an hour per letter to accomplish this task. The total number of letters is computed as the number of current unauthorized employees plus two-thirds of the current authorized employees. ${ }^{48}$ See Appendix I for more information on these costs.

## Initial Meeting with Employee

It is assumed that all of the no-match employees who receive the written request for name/SSN verification will meet with a Compensation/Benefits/Employment Specialist (or equivalent) to review the information the company has on file. ${ }^{49}$ This meeting is expected to take 15 minutes. There is also an opportunity cost on the employee's time, which is discussed separately below.

## HR Assistance Rendered to Employee

It is assumed that one-third of the remaining authorized no-match employees will not have their no-matches resolved during the initial record check or during the employees' first meeting with HR. These employees will have to interact with SSA and other government agencies in order to resolve their no-matches. For reasons stated above, the employer is expected to provide assistance in this matter. Assistance could include help in drafting letters, filling out forms, contacting government agencies to request documentation, or other miscellaneous matters. We assume that this assistance will include 1 hour of labor from a Compensation/Benefits/Employment Specialist (or equivalent), 15 minutes of which will be spent meeting with the employee for a second time, and 45 minutes of which will be spent on other related matters in which the employee is not directly involved. Regarding unauthorized employees, it is assumed that they will not seek HR assistance.

## Cost Estimates

Exhibit 16 presents the HR labor costs required to administer the safe-harbor procedures. The costs depend upon the number of authorized and unauthorized employees assumed to be on staff when the firm receives the no-match letter. Therefore, the table exhibits different cost estimates for the different assumptions regarding this matter. For each

[^24]given size class, note that the costs decrease as the percentage of no-match employees who are assumed to be unauthorized increases. This finding results primarily from the assumption that only authorized employees will seek HR assistance to help resolve their no-match discrepancies. As a result, the costs decrease as the number of authorized nomatch employees decreases.

| Exhibit 16: <br> Average HR Labor Costs Per Firm by Employment Size Class (\$) |  |  |  |  |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: |
| Employment <br> Size Class | Percentage of Current No-Match Employees Assumed to Be Unauthorized |  |  |  |  |  |  |  |
|  | $\mathbf{1 0 \%}$ |  | $\mathbf{2 0 \%}$ |  | $\mathbf{4 0 \%}$ |  | $\mathbf{6 0 \%}$ | $\mathbf{8 0 \%}$ |
| $5-9$ | 355 | 351 | 343 | 335 | 326 |  |  |  |
| $10-19$ | 390 | 385 | 374 | 364 | 354 |  |  |  |
| $20-49$ | 505 | 496 | 478 | 461 | 443 |  |  |  |
| $50-99$ | 622 | 609 | 585 | 560 | 536 |  |  |  |
| $100-499$ | 2,032 | 1,978 | 1,870 | 1,762 | 1,654 |  |  |  |
| $500+$ | 3,065 | 2,980 | 2,811 | 2,642 | 2,473 |  |  |  |

In order to show a sample calculation, we are going to show how the $\$ 355$ in the 5-9 "Employment Size Class" row in Exhibit 16 was derived:

Cost of Form Letters $=\$ 32.93 \times 4,866$ employers $^{50}=\$ 160,237$
Cost of Identifying Employees on No-Match Letter $=\$ 181.09$ X 4,866 employers $=$ \$881,184
Cost of Reviewing Employee Records $=0.25$ hour X $\$ 37.23$ X 23,984 employees $^{51}=$ \$223,231
Cost of Initial Letter to Employee $=0.1$ hour X $\$ 24.34$ X 16,788 employees ${ }^{52}=\$ 40,862$
Cost of Initial Meeting with Employee $=0.25$ hour X $\$ 37.23$ X 16,788 = \$156,254
HR Assistance to Employee $=1$ hour $\mathrm{X} \$ 37.23 \mathrm{X}\left(1 / 3 \mathrm{X} 21,585\right.$ employees $\left.^{53}\right)=$ \$267,870

Total of HR Labor Costs from above $=\$ 160,237+\$ 881,184+\$ 223,231+\$ 40,862+$ $\$ 156,254+\$ 267,870=\$ 1,729,638$

Total Cost of HR Labor Cost on a Per Employer Basis $=\$ 1,729,638 / 4,866$ employers $=$ \$355

## III.G Cost of Employee Time

The employer incurs costs in the form of lost productivity whenever the employee has to deal with the no-match issue by taking time off work or by engaging in activities not

[^25]directly related to his/her job. These costs are considered to be the value of the employee's time multiplied by the number of hours that are lost.

There are four occasions when these costs come into play. First, all of the remaining nomatch employees except for one-third of the remaining authorized employees (whose nomatches are assumed to be resolved during the initial review) have an initial meeting with HR. One-third of the remaining authorized no-match employees are also expected to have a second follow-up meeting. It is assumed that each meeting will require 1 hour of the employee's time, which includes the time it will take the employee to get to the meeting and back to his/her work station (we assume 15 minutes of actual meeting time plus 45 minutes that include waiting and travel time).

Third, the employees who have the follow-up meeting are also expected to have to take a full day off work (i.e., 8 hours) to visit an SSA office. This 8 -hour estimate is based on a combination of judgment and two DHS reports on the E-Verify program (formerly known as the Web-Based Basic Pilot). E-Verify is an Internet-based system operated by the Department of Homeland Security in partnership with the Social Security Administration. The program allows participating employers to electronically verify the employment eligibility of their newly hired employees.

Under E-Verify, when a person's information (name, date of birth, and SSN) doesn't match, that person is flagged with a "tentative non-confirmation" and must visit an SSA office. As part of an evaluation of the program, employees who received nonconfirmations were interviewed about the costs that they subsequently incurred. As stated in one of the reports:

Most of the 28 employees that went to an SSA office reported that they did not have to spend much time at the local SSA offices either waiting or speaking with a representative. Three employees reported having to wait for approximately 2 hours, and two employees reported the process took them all day. Another employee took the whole day off and lost that day's wages because he was not sure how long the process would take. ${ }^{54}$

An earlier Westat report also discussed the amount of personal time that employees needed to take off work to resolve work authorization issues:

Among the employees who contacted SSA or INS to clear up their workauthorization problems ( $n=67$ ), close to half reported using personal time. The amount of personal time spent resolving these problems ranged between 1 and 16 hours, with an average of 4 hours per employee. Forty-five percent needed time off from work, and more than a third missed time at work. The work time lost ranged between 1 and 16 hours, with an average of 5 hours. ${ }^{55}$

[^26]These two Westat reports contain valuable information regarding how long it would take an employee to visit the local SSA office to address the "tentative non-confirmation" received from E-verify. It appears that most of the people needing to visit their local SSA office to update their information were able to do so in less than a day. However, for the purpose of this analysis, we will assume a visit to the SSA will take a full 8 hours, as there may be a small number of employees that require more than one visit to the office.

Finally, employees may need to use the phone during regular business hours to contact SSA or other government agencies. We assume that employers will lose an hour of work from one-third of the current authorized employees due to time spent on the phone.

Exhibit 17 presents the opportunity cost associated with the employees' time. The costs depend upon the number of authorized and unauthorized employees assumed to be on staff when the firm receives the no-match letter. Therefore, the table displays different cost estimates for the different assumptions regarding this matter. For each given size class, note that the costs decrease as the percentage of no-match employees who are assumed to be unauthorized increases. ${ }^{56}$ This finding results primarily from the assumption that only authorized employees will take a day off work to visit an SSA office to resolve their no-match discrepancies. As a result, the costs decrease as the number of authorized no-match employees decreases. See Appendix J for more information on how these numbers were calculated.

| Average Opportunity Cost of Employees' Labor Time Per Firm <br> by Employment Size Class (\$) |  |  |  |  |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: |
| Employment <br> Size Class | Percentage of Current No-Match Employees Assumed to Be Unauthorized |  |  |  |  |  |  |  |
|  | $\mathbf{1 0 \%}$ |  | $\mathbf{2 0 \%}$ |  | $\mathbf{4 0 \%}$ |  | $\mathbf{6 0 \%}$ | $\mathbf{8 0 \%}$ |
| $5-9$ | 503 | 462 | 381 | 299 | 217 |  |  |  |
| $10-19$ | 623 | 572 | 471 | 370 | 269 |  |  |  |
| $20-49$ | 1,056 | 970 | 799 | 628 | 456 |  |  |  |
| $50-99$ | 1,471 | 1,351 | 1,113 | 874 | 636 |  |  |  |
| $100-499$ | 6,484 | 5,959 | 4,907 | 3,856 | 2,804 |  |  |  |
| $500+$ | 10,158 | 9,334 | 7,687 | 6,040 | 4,393 |  |  |  |

In order to show a sample calculation, we are going to show how the $\$ 503$ in the 5-9 "Employment Size Class" row in Exhibit 17 was derived:

Initial Meeting with $\mathrm{HR}=1$ hour $\mathrm{X}\left(2,398\right.$ unauthorized employees ${ }^{57}+2 / 3 \mathrm{X} 21,585$ authorized employees ${ }^{58}$ ) X $\$ 27.58^{59}=\$ 463,013$

[^27]Follow-up Meeting with HR = 1 hour X 1/3 X 21,585 authorized employees X $\$ 27.58=$ \$198,438
Phone Calls During Business Hours $=1$ hour X $1 / 3$ X 21,585 authorized employees X $\$ 27.58=\$ 198,438$
Trip to Local SSA Office $=8$ hours X 1/3 X 21,585 authorized employees X \$27.58 = \$1,587,505

Total of Employee Opportunity Costs $=\$ 463,013+\$ 198,438+\$ 198,438+\$ 1,587,505=$ \$2,447,394

Total of Employee Opportunity Costs on a Per Employer Basis $=$ \$2,447,394/4,866 employers ${ }^{60}=\$ 503$

## III.H Miscellaneous Administrative Costs

## Phone Charges

To help employees resolve their no-match discrepancies, it is assumed that employers will pick up some related phone charges for one-third of the authorized no-match employees (i.e., those authorized employees who did not have their cases resolved during the initial review or during their initial meeting with HR). The employees may need to use the phone during regular business hours to contact SSA about their case or other government agencies about how to obtain required documentation (e.g., a birth certificate). For each of the authorized employees who solicit HR assistance, we assume that the phone expenses will consist of 1 hour worth of phone service at 10 cents per minute ( $\$ 6$ per hour).

## Postage

When it sends out its initial request for verification, it is assumed that a firm will spend 50 cents on postage for each current unauthorized no-match employee and two-thirds of the current authorized no-match employees. ${ }^{61}$ An additional 50 cents per employee is assumed to be expended on postage for those authorized employees who seek assistance from HR (i.e., one-third of the total authorized no-match employees). This postage will be used to send correspondence to the employee, to request official documents from local and State government agencies, and to submit documentation to SSA. Finally, postage will be needed for the submission of corrected $\mathrm{W}-2 \mathrm{~s}$ for those authorized employees who are able to resolve their no-matches. ${ }^{62}$ Three copies of the corrected forms will need to be mailed: one to SSA, one to the State government of the employee's resident State, and

[^28]one to the employee. ${ }^{63}$ Again, it is assumed that the employer will spend 50 cents on each item that is mailed.

## Printing and Paper

Each piece of paper that is printed for documentation purposes or other reasons is assumed to cost $\$ 1$. We assume that the initial letter that the employer sends to current employees (all unauthorized employees plus two-thirds of the authorized employees whose no-matches were not resolved during the initial review of employee records), requesting verification of name or SSN, will be one page in length. It is assumed that those authorized employees who seek assistance from HR will require an additional 10 pages of printed material that are obtained over the Internet. Such material could include instructions for completing requests for official documents (e.g., a birth certificate), forms that need to be submitted to SSA, et cetera. Finally, the employer will need to print out three copies of the corrected W-2s associated with those authorized employees who are able to resolve their no-matches.

## Cost Estimates

Exhibit 18 presents the total miscellaneous costs associated with the no-match rule. The costs depend upon the number of authorized and unauthorized employees assumed to be on staff when the firm receives the no-match letter. Therefore, the table depicts different cost estimates for the different assumptions regarding this matter. For each given size class, note that the costs decrease as the percentage of no-match employees who are assumed to be unauthorized increases. Many of these costs are generated by the authorized employees who seek HR assistance to resolve their no-matches. As a result, the costs decrease as the number of authorized no-match employees decreases. See Appendix K for more information on how these numbers were calculated.

| Exhibit 18: <br> Miscellaneous Expenses Per Firm by Employment Size Class (\$) |  |  |  |  |  |  |  |  |
| :---: | :---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: |
| Employment <br> Size Class | Percentage of Current No-Match Employees Assumed to Be Unauthorized |  |  |  |  |  |  |  |
|  | $\mathbf{1 0 \%}$ |  | $\mathbf{2 0 \%}$ |  | $\mathbf{4 0 \%}$ |  | $\mathbf{6 0 \%}$ | $\mathbf{8 0 \%}$ |
| $5-9$ | 49 | 45 | 35 | 26 | $\mathbf{1 7}$ |  |  |  |
| $10-19$ | 61 | 55 | 44 | 32 | 21 |  |  |  |
| $20-49$ | 103 | 93 | 74 | 54 | 35 |  |  |  |
| $50-99$ | 144 | 130 | 103 | 76 | 49 |  |  |  |
| $100-499$ | 634 | 574 | 454 | 335 | 215 |  |  |  |
| $500+$ | 992 | 899 | 711 | 524 | 337 |  |  |  |

In order to show a sample calculation, we are going to show how the $\$ 49$ in the 5-9 "Employment Size Class" row in Exhibit 18 was derived:

[^29]Cost of Phone Charges $=\$ 6$ X 1 hour X 1/3 X 21,585 authorized employees ${ }^{64}=\$ 43,170$
Cost of Postage for Initial Request for Verification $=\$ 0.50 \mathrm{X}$ ( 2,398 unauthorized employees ${ }^{65}+2 / 3 \times 21,585$ authorized employees $)=\$ 8,394$
Cost of Postage for Authorized Employees Who Seek Assistance from HR $=\$ 0.50$ X 1/3 X 21,585 authorized employees $=\$ 3,598$
Cost of Postage for W-2c Forms $=\$ 0.50$ X 3 copies X 98\% X 21,585 authorized employees $=\$ 31,730$
Total Cost of Postage $=\$ 8,394+\$ 3,598+\$ 37,730=\$ 43,722$
Cost of Printing Initial Request for Verification Letter = \$1 X 1 page X $(2,398$ unauthorized employees $+2 / 3$ X 21,585 authorized employees) $=\$ 16,788$
Cost of Printing for Employees Requesting HR Assistance = \$1 X 10 pages X 1/3 X 21,585 authorized employees $=\$ 71,950$
Cost of Printing Corrected W-2s = \$1 X 1 page X 3 copies X 98\% X 21,585 authorized employees $=\$ 63,460$
Total Cost of Printing $=\$ 16,788+\$ 71,950+\$ 63,460=\$ 152,198$
Total of Miscellaneous and Admin Costs $=\$ 43,170+\$ 43,722+\$ 152,198=\$ 239,090$
Total of Miscellaneous and Admin Costs on a Per Employer Basis: \$239,090/4,866 employers ${ }^{66}=\$ 49$

## III.I Costs of Research, Management and Internal Meetings

Upon receiving a no-match letter, it is assumed that HR personnel (or equivalent) will need to conduct some research to understand and familiarize themselves with the nomatch rule. As part of this familiarization process, HR staff may also need to discuss the issues internally as well as meet with legal counsel. The amount of time dedicated to these activities is expected to be a function of firm size, because larger companies will require more HR personnel to address their relatively greater number of no-matches.

We assume that all firms, regardless of size, will require that a Compensation and Benefits Manager (or equivalent) spend at least 24 hours researching the topic and managing the company's response. As shown below in the second column in Exhibit 19, we assume that this time commitment will increase as the companies become larger. For the two largest size classes, the allotted time could reflect multiple executives who spend time on the matter.

Compensation and benefits specialists (or equivalent) are also assumed to participate in these activities, but to a lesser extent than management. It is assumed that the specialists will provide support to management, conduct research, and may attend some internal meetings. The third column in Exhibit 19 shows the assumed number of hours that the specialists will need to spend in this capacity. Note that many of the expected duties of the specialist have already been identified and valued in previous sections.

[^30]For each employment size class, the estimated hours in columns two and three are multiplied by the corresponding wage rates and then summed to produce the cost estimates. The first two rows in the table are equal to 24 hours multiplied by $\$ 57.28$, the loaded average hourly wage rate for a Compensation and Benefits Manager. For the 100499 employment size class, $\$ 6,071$ is equal to $\$ 4,582$ (the cost of a Compensation and Benefits Manager for 80 hours) plus 40 hours multiplied by $\$ 37.23$ (the loaded hourly wage for a Compensation and Benefits Specialist).

| Costs of Research, Management and 19: <br> By Employment Size Class (\$) |  |  |  |
| :---: | :---: | :---: | :---: |
| Employment <br> Size Class | Labor Hours Spent on Research and Internal Meetings | Average Cost <br> Compensation/Benefits <br> Manager | Compensation/Benefits <br> Specialist |
|  | 24 | N/A | 1,375 <br> $10-19$$\quad 24$ |
|  | 32 | N/A | 1,375 |
| $50-99$ | 40 | 8 | 2,131 |
| $100-499$ | 80 | 16 | 2,887 |
| $500+$ | 100 | 40 | 6,071 |

## III.J Employee Replacement (Turnover) Costs

As we have previously explained, termination and replacement costs for unauthorized workers are not included in this analysis as a cost of adopting the safe-harbor procedures in the no-match rule. The INA expressly prohibits employers from knowingly hiring or knowingly continuing to employ aliens who are not authorized to work in the United States, and so the costs that result from an employer's knowledge of certain workers' unauthorized status are attributable to the INA rather than to the no-match rule. However, to the extent the safe-harbor procedures could result in the termination of a worker authorized to work in the United States, such termination and replacement costs could be considered costs resulting from the safe-harbor procedures and not costs resulting from the INA.

Turnover costs include the direct costs of terminating an employee, such as the administrative functions related to the termination, costs of finding an appropriate replacement (advertising, interviewing applicants, background checks, etc.), and additional overtime by other employees to cover for the loss of the terminated employees' services. In addition to these direct costs, employers incur indirect costs such as lost productivity due to the job vacancy and lost productivity due to the learning curve necessary for a new employee to learn a new job. ${ }^{67}$

[^31]We expect the termination of authorized workers due to the safe-harbor procedures to happen only under very unusual circumstances. We believe that the employer has an economic incentive to assist authorized workers with correcting the no-match discrepancy (if such assistance is required) as employers would incur turnover costs if an authorized worker was terminated and replaced. Similarly, the authorized worker has an economic incentive to ensure his/her name and SSN properly match SSA's records; both to preserve his/her job, and to ensure that he or she receives full credit for the contributions made into Social Security in order to maximize the amount of Social Security benefits the individual will receive in retirement. Nevertheless, there may be some circumstances in which an authorized employee could be terminated under the safeharbor procedures. For example, an authorized worker could simply refuse to visit his/her local Social Security office to correct the circumstances causing his/her name and SSN not to match SSA's records. Also, we cannot rule out the possibility that, despite reasonably diligent efforts by the employer and/or employee, they could not resolve the discrepancy within the 93 days as set forth in the no-match procedures. Such situations may arise if an employee was unable to procure documents verifying his/her identity from a State or local authority within a 3-month period. Although nothing in the nomatch rule requires an employer to terminate an employee after 93 days, an employer that intends to strictly adhere to the safe-harbor procedures in the rule may decide to terminate the employee and incur the resulting turnover costs.

In order to estimate the cost to the employer of terminating authorized workers due to the safe-harbor procedures, we need to know both the rate at which authorized workers would be terminated and the per capita termination and replacement costs incurred by employers. Unfortunately, we do not have empirical data on which to base an authorized worker termination rate. Due to the previously discussed economic incentives for both the employer and employee to correct no-match discrepancies, we believe the rate would be very low. For the purpose of this analysis, we will assume a termination rate of 2 percent for authorized workers, but we believe this 2-percent estimate to be a conservative (i.e., high) estimate.

Concerning the costs of employee turnover, there are several studies that provide estimates of the costs of employee turnover to the employer on which we can base a rough estimate:

- A study conducted by the Cornell Hotel \& Restaurant Administration Quarterly and published in year 2000 estimated turnover costs in Miami hotels for several occupations. The cost of turnover was estimated to be $\$ 1,333$ for room service wait staff, $\$ 2,077$ for a line cook, $\$ 3,383$ for a gift-shop clerk, $\$ 5,965$ for a frontoffice associate, and $\$ 7,658$ for an administrative assistant (sales and catering). The authors also estimated the cost of replacing a front office associate in a New York City hotel. A front office associate in New York City was estimated to cost an average of approximately $\$ 12,250$ to replace. ${ }^{68}{ }^{69}$ This study was a

[^32]comprehensive analysis of both the direct and indirect costs of turnover and included such indirect costs as lost productivity. The authors noted that "the direct, easily measurable hard costs associated with turnover account for less than half of total costs" and "although over half of turnover's costs are indirect and difficult to measure, they still exist and are felt by the organization."

- A study conducted by the University of Massachusetts Political Economy Research Institute in the year 2000 found that employers located in Santa Monica, California estimated their costs to replace an existing non-managerial worker with a new worker to be $\$ 2,090 .{ }^{70}$ Workers were predominately from hotels, restaurants, and retail establishments. Replacement costs estimated by employers included separation, search, and training costs, but did not include lost productivity.
- A study conducted in 2004 suggests that "a minimum direct cost of turnover per worker of at least $\$ 2,500$ is supported by the existing empirical literature on frontline turnover costs in long-term care as well as low-wage service employment generally." ${ }^{71}$ The author also stated "the indirect costs of turnover may be substantial and tend to be overlooked because they are less visible and harder to measure."
- A study conducted by the Coca-Cola Research Council in the year 2000 found that the turnover costs of replacing a supermarket cashier range from $\$ 2,286$ to $\$ 4,313$, and the costs of replacing "other hourly personnel" (i.e., baggers and stockers) range from $\$ 3,372$ to $\$ 4,291 .^{72}$ This study included both direct costs and opportunity costs.

As we have previously discussed, we do not know which specific companies receive the no-match letters, and the employees listed on no-match letters span the full range of occupations in the United States. ${ }^{74}$ Also, the authors of the studies we reviewed noted the difficulty in measuring indirect costs. Given this uncertainty, for the purpose of this economic analysis, we will use an estimate of $\$ 5,000$ to calculate the turnover costs of authorized employees terminated due to the no-match procedures. A $\$ 5,000$ estimate is well within the range of turnover costs cited by the literature we reviewed, and we

[^33]believe it is a reasonable number for purposes of our analysis. Under the assumption that 2 percent of the authorized employees will be terminated, Exhibit 20 presents the average turnover cost per firm across all firms. These figures are tabulated by multiplying the number of authorized employees in Exhibit 13 by 2 percent to determine the number of terminations, then multiplying that product by $\$ 5,000$ to determine the total cost.

| Turnover Cost Per Firm by Employment Size Class (\$) |  |  |  |  |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: |
| Employment <br> Size Class | Percentage of Current No-Match Employees Assumed to Be Unauthorized |  |  |  |  |  |  |  |
|  | $\mathbf{1 0 \%}$ |  | $\mathbf{2 0 \%}$ |  | $\mathbf{4 0 \%}$ |  | $\mathbf{6 0 \%}$ | $\mathbf{8 0 \%}$ |
| $5-9$ | 444 | 394 | 296 | 197 | 99 |  |  |  |
| $10-19$ | 550 | 488 | 366 | 244 | 122 |  |  |  |
| $20-49$ | 931 | 828 | 621 | 414 | 207 |  |  |  |
| $50-99$ | 1,297 | 1,153 | 865 | 577 | 288 |  |  |  |
| $100-499$ | 5,720 | 5,084 | 3,813 | 2,542 | 1,271 |  |  |  |
| $500+$ | 8,960 | 7,965 | 5,973 | 3,982 | 1,991 |  |  |  |

In order to show a sample calculation, we are going to show how the $\$ 444$ in the 5-9 "Employment Size Class" row in Exhibit 20 was derived:

Cost of Turnover Due to the Termination of Authorized Employees: 2\% termination rate X 21,585 employees ${ }^{75}$ X \$5,000 turnover costs $=\$ 2,158,500$

Cost of Turnover Due to the Termination of Authorized Employees on a Per Employer Basis: $\$ 2,158,500 / 4,866$ employers $^{76}=\$ 444$

## III.K Total Compliance Cost Estimates

In Exhibit 21, the various cost elements have been summed up to produce the total estimated compliance costs on a per firm basis associated with the rule. Each cell in the table shows the average compliance cost per firm for those firms in the designated size class (specified in the first column), assuming that a certain percentage of the no-matches in the size class are unauthorized employees (specified in the third row). The costs in the table range between $\$ 3,009$ and $\$ 33,759$. Because DHS does not have adequate data to estimate the percentage of unauthorized employees listed on no-match letters, for the purpose of this analysis, we estimated costs based on various ratios of authorized to unauthorized workers (i.e. $20 \%$ unauthorized $-80 \%$ authorized) .

In interpreting these costs, please note that these estimates were based on a series of assumptions which are explained in detail previously in this analysis. Consequently, the costs a specific firm incurs due to this rule may be higher or lower than the average firm costs estimated in Exhibit 21.

[^34]| Total Costs Per Firm by Employment Size Class (\$) |  |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: |
| Employment <br> Size Class | Percentage of Current No-Match Employees Assumed to Be Unauthorized |  |  |  |  |
|  | $\mathbf{1 0 \%}$ | $\mathbf{2 0 \%}$ | $\mathbf{4 0 \%}$ | $\mathbf{6 0 \%}$ | $\mathbf{8 0 \%}$ |
| $5-9$ | 3,737 | 3,633 | 3,425 | 3,217 | 3,009 |
| $10-19$ | 4,020 | 3,891 | 3,634 | 3,376 | 3,119 |
| $20-49$ | 5,786 | 5,568 | 5,132 | 4,695 | 4,259 |
| $50-99$ | 7,517 | 7,214 | 6,606 | 5,998 | 5,391 |
| $100-499$ | 22,488 | 21,148 | 18,469 | 15,789 | 13,110 |
| $500+$ | 33,759 | 31,660 | 27,462 | 23,265 | 19,067 |

Costs associated with research, management and internal meetings are the largest cost component and contribute 26 percent to 54 percent of the total costs per firm, with an average of 39 percent. Legal costs account for 16 percent of the total, falling between 3 percent and 32 percent. Together, legal and research/management/internal meetings comprise 55 percent of the total cost. The second largest cost contributor is the loss in productivity when employees have to take time off their normal duties to deal with the no-match issue; this factor accounts for 7 percent to 30 percent of the total costs, with an average of 18 percent. Costs associated with the turnover of authorized employees comprise just over 13 percent of the total costs, ranging between 3 percent and 27 percent. HR labor to administer the program constitutes between 8 percent and 13 percent of total costs; the average for this category is 10 percent. The accounting share is close to 2 percent, ranging between 0.9 percent and 2.8 percent. Miscellaneous expenses make up the remainder, contributing 0.6 percent to 2.9 percent of the total costs per firm, with an average of 1.6 percent.

In Exhibit 22, the costs per firm for the 40-percent category in Exhibit 21 have been mapped against average employment levels per firm for those size classes. ${ }^{77}$ A logarithmic trend is evident, showing that the increase in the cost per firm dampens considerably when the employment level moves from 200 employees to 3,300 employees. The same trend occurs for the other assumptions about the percentage of nomatch employees made up by unauthorized employees. The trend results from the number of no-match employees per firm, which has a very similar curve that dampens when plotted against the total number of employees per firm (see Exhibit 23). This finding suggests that the total cost impacts are strongly influenced by the variable costs generated by the number of no-matches. The strength of this relationship is demonstrated in Exhibit 24, which shows an almost perfect linear relationship between average cost per firm and the number of no-matches per firm.

[^35]Exhibit 22:

Exhibit 23:

Exhibit 24:

## III.L Revenues

To assess the level of cost impacts, average revenues per firm are needed for each size class. In the following section, the revenues per firm are compared with the estimated costs per firm. It is assumed that the average revenues per firm across all firms in the U.S. economy can represent the average revenues per firm for no-match employers.

The methodology used to estimate revenues per firm can be summarized as follows. Estimates of total receipts by employment size class were divided by estimates of the total number of firms by employment size class. Total receipts were estimated by adding farms receipts and total receipts for non-agricultural industries. The total number of firms was estimated in a similar fashion: the number of farms was added to the total number of firms in non-agricultural industries.

Two primary sources of data were used for the computations. For the agriculture sector, the 2002 Census of Agriculture provides data on receipts and other useful information. Regarding these data, it should be noted that both receipts and the number of farms refer only to farms that utilize hired labor. See Appendix D for source information and details on how the agricultural census data were used to estimate receipts and number of farms for the different employment size classes used in the analysis.

For the non-agricultural industries, data for year 2002 on SBA's website include employment, number of firms, and receipts for different employment size classes. ${ }^{78}$ One of the employment size classes used to characterize these data (20-99 employees) combines two of the size classes used in this analysis (20-49 employees, and 50-99 employees). For this reason, procedures were developed to allocate the data for the 20-99 employee size class into estimates for the 20-49 and 50-99 employment size classes. Details on this procedure can be found in Appendix L.

Exhibit 25 provides the supporting data and resulting revenue estimates for each employment size class used in the analysis. Note that the revenues per firm have been inflated into 2006 dollars using an inflation factor of 1.12. This factor was obtained from BLS's CPI inflation calculator. ${ }^{79}$

| Exhibit 25: Revenues per Firm by Employment Size Class (\$) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Size <br> Class | Non-Agricultural Firms (2002) |  | Farms(2002) |  | Total (2002) |  | Receipts per Firm |  |
|  | Number* | Revenues | Number | Revenues | Number | Revenues | 2002 | 2006 |
| 1-4 | 2,695,606 | 937,533,365 | 434,088 | 12,493,836 | 3,129,694 | 950,027,201 | 303,553 | 339,979 |
| 5-9 | 1,010,804 | 888,342,543 | 93,972 | 45,451,517 | 1,104,776 | 933,794,060 | 845,234 | 946,662 |
| 10-19 | 613,880 | 1,085,595,864 | 13,187 | 16,008,771 | 627,067 | 1,101,604,635 | 1,756,757 | 1,967,568 |
| 20-49 | 258,819 | 923,780,691 | 6,594 | 22,310,762 | 265,413 | 946,091,454 | 3,564,601 | 3,992,353 |
| 50-99 | 249,430 | 1,960,915,957 | 6,594 | 50,045,824 | 256,023 | 2,010,961,781 | 7,854,614 | 8,797,167 |
| $\begin{aligned} & 100- \\ & 499 \end{aligned}$ | 82,334 | 2,547,423,855 | 0 | 0 | 82,334 | 2,547,423,855 | 30,940,120 | 34,652,935 |
| 500+ | 16,845 | 13,503,796,863 | 0 | 0 | 16,845 | 13,503,796,863 | 801,650,155 | 897,848,174 |

*These data are 2002 vintage and correspond to SBA's revenue data which are only available for 2002. Note that the number of firms in Exhibit 4, Exhibit B.1, and Exhibit B. 3 are based on SBA size class data for 2004. Although the 2004 data on the number of firms are more recent and detailed than the 2002 data, we believed it was more appropriate to calibrate the 2002 revenue data with the number of firms for 2002.

## III.M Impacts

This section consolidates the previous results and presents an analysis of how the SafeHarbor rule will affect small entities. The discussion looks both at the number of firms that are affected as well as the cost impacts.

Exhibit 26 compares the distribution of no-match employers across employment size classes with the same distribution of U.S. employers. ${ }^{80}$ In contrast to the norm, it can be seen that there are relatively more no-match employers in the larger size classes ( 50 employees or greater) and relatively few employers in the smallest size class. For all

[^36]U.S. companies, there is a high concentration of firms in the smallest size class (46.9\%), which falls to a very small percentage for the largest size class ( $0.7 \%$ ). This same pattern is not evident among the no-match employers, which are more highly concentrated in the larger size classes. For example, 46 percent of the no-match companies employ more than 50 people, whereas only 10 percent of all U.S. companies employ more than 50 people. In terms of the number of firms that are affected, the graph illustrates that there is not a disproportionate impact on the smaller size classes.

Exhibit 26:

In the following table, the average cost impacts per firm (shown in Exhibit 21) have been divided by average revenues per firm (Exhibit 25: column 9). The resulting figures help define the extent to which businesses of different sizes will be able to absorb the costs of the compliance requirements.

| Costs Per Firm as a Percentage of Revenue per Firm |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Employment <br> Size Class | Percentage of Current No-Match Employees Assumed to Be Unauthorized |  |  |  |  |
|  | $\mathbf{1 0 \%}$ | $\mathbf{2 0 \%}$ | $\mathbf{4 0 \%}$ | $\mathbf{6 0 \%}$ | $\mathbf{8 0 \%}$ |
| $5-9$ | $0.39 \%$ | $0.38 \%$ | $0.36 \%$ | $0.34 \%$ | $0.32 \%$ |
| $10-19$ | $0.20 \%$ | $0.20 \%$ | $0.18 \%$ | $0.17 \%$ | $0.16 \%$ |
| $20-49$ | $0.14 \%$ | $0.14 \%$ | $0.13 \%$ | $0.12 \%$ | $0.11 \%$ |
| $50-99$ | $0.09 \%$ | $0.08 \%$ | $0.08 \%$ | $0.07 \%$ | $0.06 \%$ |
| $100-499$ | $0.06 \%$ | $0.06 \%$ | $0.05 \%$ | $0.05 \%$ | $0.04 \%$ |
| $500+$ | $0.004 \%$ | $0.004 \%$ | $0.003 \%$ | $0.003 \%$ | $0.002 \%$ |

Two observations are noteworthy. First, the percentage of no-match employees assumed to be unauthorized appears to have little impact on the ratios. This can be seen in the first row for firms with 5-9 employees; costs are 0.39 percent of revenues if 10 percent of the no-match employees are assumed to be unauthorized, which decreases to 0.32 percent if it is assumed that unauthorized employees comprise 80 percent of the no-match employees.

Second, the relative impacts decrease as firm size increases. For each of the five assumptions about the percentage of no-match employees who are unauthorized, the percentages for the largest size class are less than one one-hundredth of the percentages for the smallest size class. While this trend does suggest a disproportionate cost impact on the smaller size classes, the estimated impact on the smallest class is still relatively small on an average per firm basis.

## Appendix A: Conversion of SSA Data into Estimates by Average Employment Level

As noted in the text, it was necessary to translate the SSA no-match counts (number of employers and number of employees) by number of W-2s submitted into counts based upon average employment levels. Unlike an average employment level, the annual number of W-2s captures all of the employees who were on staff throughout the year and does not take into consideration employee turnover. This appendix describes the data and computations used to carry out the necessary adjustments. The first section defines the methodology and equations used to convert the number of $\mathrm{W}-2 \mathrm{~s}$ into average employment estimates. The second section presents the adjustments made to the number of firms receiving no-match letters. The third section describes the adjustments made to the number of employees listed on the no-match letters. In both cases, it should be emphasized that the adjustments do not affect the total counts of the total number of nomatch employers and no-match SSNs as reported to DHS by SSA. Rather, the distribution of those counts is simply shifted into different categories.

## Use of BLS Annual Hire Rates to Estimate Average Employment Levels

Employment size class data generally refer to average employment levels or levels of employment at particular points in time: for example, some sources measure employment levels at mid-March. These employment size classes typically reflect the levels of employment that are utilized on a somewhat normal basis.

SSA provided data on the number of no-match letter recipients and affected employees by the total number of W-2s that the employers submitted during the year. The counts were aggregated into the categories shown in Exhibit A. 1 on the next page.

Exhibit A.1:

| Number of W-2s Submitted by <br> Employer | Number of No-Match Letter <br> Recipient Employers | Number of Employees Listed <br> on No-Match Letters ${ }^{81}$ |
| :---: | :---: | :---: |
| $11-19$ | 6,725 | 84,732 |
| $20-49$ | 42,879 | 770,529 |
| $50-99$ | 38,057 | $1,088,449$ |
| $100-499$ | 41,048 | $2,557,994$ |
| $500+$ | 12,126 | $4,661,954$ |

The number of $\mathrm{W}-2 \mathrm{~s}$ submitted depends not only on the average employment level throughout the year, but also on the labor turnover rate. This means that a small company with less than ten employees on staff at any given time, but a high labor turnover rate, could receive a no-match letter even though SSA only sends letters to employers who submit more than ten no-matches.

To be able to conduct the analysis using typically employment size categories, it was necessary to develop a translation between average employment levels and the number of $\mathrm{W}-2 \mathrm{~s}$ submitted. This translation is based upon the following: it was assumed that the number of $\mathrm{W}-2 \mathrm{~s}$ submitted equals the average employment level plus the number of people who are hired throughout the year. In other words,

$$
\mathrm{W} 2=\mathrm{E}+\mathrm{H},
$$

where E refers to average employment level and H refers to the number of hires.
BLS publishes annual industry hire rates that can be used to estimate the number of hires throughout the year (the hire rate multiplied by total employment equals the number of hires). This equation can be stated as follows:

$$
\mathrm{H}=\mathrm{R} * \mathrm{E},
$$

where R refers to the Hire Rate. Together, the two formulas above imply the following relationship between employment levels and the number of W-2s:

[^37]\[

$$
\begin{gathered}
\mathrm{W} 2=\mathrm{E} *(1+\mathrm{R}) \text { or } \\
\mathrm{E}=\mathrm{W} 2 /(1+\mathrm{R})
\end{gathered}
$$
\]

Appendix C provides information on the development of a weighted average hire rate that was used for the analysis; the estimated rate is 60.5 percent. Inserting that rate into the above formula produces an estimated employment level given the total number of W$2 s$ that are submitted. In the following table, employment levels have been estimated for a range of possible W-2 submissions. Note that these W-2 numbers in this range together make up the smallest W-2 size class category (11-19) used to tabulate the SSA counts.

Exhibit A.2:

| Total Number of W-2s <br> Submitted by Employer | Estimated Average <br> Employment Size |
| :---: | :---: |
| 11 | 6.9 |
| 12 | 7.5 |
| 13 | 8.1 |
| 14 | 8.7 |
| 15 | 9.3 |
| 16 | 10.0 |
| 17 | 10.6 |
| 18 | 11.2 |
| 19 | 11.8 |

Accordingly, it can be seen that some of the employers in this W-2 size class will fall into the 5-9 average employment level size class, whereas others need to be grouped in the 10-19 average employment level size class. For this reason, it was necessary to develop procedures that could be used to allocate the employer and employee counts in each W-2 size class to corresponding average employment size classes. The remainder of the appendix describes these procedures.

## Adjustments to the Distribution of Firm Counts

A single regression was estimated and then used to develop specific size distributions for each W-2 size class listed above in Exhibit A.2. To illustrate, the estimated size distribution for the 11-19 W-2 size class consists of nine percentages that reflect how the total number of employers in that W-2 size class are distributed to the class' constituent W-2 levels (i.e.: $11,12,13,14,15,16,17,18,19) .{ }^{82}$ The distributions were then used to allocate the number of respective employers in each $\mathrm{W}-2$ class (e.g., 11-19) across specific numbers of $\mathrm{W}-2 \mathrm{~s}$ (e.g.: $11,12,13,14,15,16,17,18,19$ ), for which average employment levels were estimated using the above formula and weighted average hire rate. As described in more detail below, the resulting employer counts were then reaggregated using the average employment size classes.

[^38]
## Use of Regression Analysis to Develop Size Distributions for Each W-2 Size Class

A regression analysis was used to develop a size distribution for each $\mathrm{W}-2$ size class. As discussed later, these distributions were necessary in order to convert the employee counts based on W-2s into employee counts based on the average number of employees.

The regression analysis estimates an equation that relates the percentage of firms by size class (the dependent variable) to the average number of employees per firm by size class (the independent variable). The data used to estimate the regression are based on SBA data on firm counts and number of employees by size class for 2004. These data are presented in Exhibit B. 1 in Appendix B. The third column in Exhibit B. 1 was used for the dependent variable and the data in the fifth column were used for the independent variable.

To determine the type of equation to estimate, we constructed a two-dimensional scatterplot of the data with the percentage of firms on the Y axis and the number of employees per firm on the X axis. The scatterplot confirmed a parabolic relationship between the two variables, which we had observed previously using other data sources. As a result, the following specification was used to relate the percentage of total firms by size class to the average number of employees per firm by size class:

$$
\text { PercentageofTotalNumberofFirms }=\alpha^{*} \text { AverageNumberofEmployeesPerFirm }{ }^{\beta} \text {, }
$$

where $\alpha$ and $\beta$ are coefficients estimated by the regression and $\beta$ is an exponent. Note that this equation can be transformed into a linear equation and estimated using Ordinary Least Squares (OLS) if both sides of the equation are converted into logarithms. The results of the estimation are presented below:

| $\mathrm{R} 2:$ | 0.8829 |
| :--- | :--- |
| $\alpha:$ | 0.4235 |
| $\beta$ | -0.8927 |

The coefficients were then used to develop initial estimates of the percentage of firms for each discreet W-2 level. In other words, we executed the following computation for all possible W-2 submissions in the analysis:

$$
\text { InitialPercentageEstimate }=0.4235 * \text { NumberofW-2sSubmitted }{ }^{-0.8927}
$$

These estimated percentages were then calibrated for each size class so that the constituent percentages would sum to 100 percent. Multiplying the percentages for each W-2 size class by the respective number of employers in the class estimates the number of employers for each discreet W-2 level. It is assumed that the distribution of firms across employment size classes is similar (in term of shape and relative differences) to the distribution of firms across W-2 classes.

For illustration purposes, these calculations are reproduced in the following table for the $11-19 \mathrm{~W}-2$ size class. Derived from the regression coefficients, the $2^{\text {nd }}$ column reports
the estimated percentage of firms accounted for by employers who submitted the number of $\mathrm{W}-2 \mathrm{~s}$ in the first column. For example, the first row shows the regression prediction that firms with 11 employees comprise 5.0 percent of all employer firms. This figure was computed as follows: $5.0 \%=0.4235 * 11^{-0.8927}$. This $5.0 \%$ figure was then calibrated by dividing it by $34.9 \%$, the sum of the predictions for the nine $\mathrm{W}-2$ levels listed in column 2 of Exhibit A.4. For example, the $14.3 \%$ in the first row of column 3 was derived by dividing the first row in column 2 by the sum of column 2 ( $5.0 \% / 34.9 \%=14.3 \%$ ). The first row in column 4 was then determined by multiplying the resulting $14.3 \%$ by 6,725 (the total number of no-match recipients who submitted 11-19 W-2s: see Exhibit A. 1 above), which yields 960: an estimate of the number of firms that submitted $11 \mathrm{~W}-2 \mathrm{~s}$.

| Exhibit A.3 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Number of W-2s <br> Submitted by <br> Employer | Percent of Firms <br> (Regression <br> Prediction) | Calibrated <br> Percent of <br> Firms for Size <br> Class | Estimated <br> Number of <br> Firms | Estimated <br> Average <br> Employment <br> Size |
| 11 | $5.0 \%$ | $14.3 \%$ | 960 | 6.9 |
| 12 | $4.6 \%$ | $13.2 \%$ | 889 | 7.5 |
| 13 | $4.3 \%$ | $12.3 \%$ | 827 | 8.1 |
| 14 | $4.0 \%$ | $11.5 \%$ | 774 | 8.7 |
| 15 | $3.8 \%$ | $10.8 \%$ | 728 | 9.3 |
| 16 | $3.6 \%$ | $10.2 \%$ | 687 | 9.9 |
| 17 | $3.4 \%$ | $9.7 \%$ | 651 | 10.6 |
| 18 | $3.2 \%$ | $9.2 \%$ | 619 | 11.2 |
| 19 | $3.1 \%$ | $8.8 \%$ | 590 | 11.8 |

The estimates of the number of firms were re-aggregated into average employment size classes using the estimated employment levels in the fifth column. Again, the average employment levels were estimated by dividing the numbers in the first column of Exhibit A. 3 by $1.605(1+60.5 \%$ (the weighted average hire rate)).

To compute the number of employers in the 5-9 average employment size class used in the main tables of this analysis, the first six rows of Exhibit A. 3 (i.e., rows in which the average employment level is less than 10) of the fourth column were summed. The numbers in the last three rows were then added to the $10-19$ average employee size class along with the calculated numbers from the 20-49 W-2 size class. Even though the other size classes are not listed in Exhibit A.3, this calculation was completed for each of the employer size groupings.

## Adjustments to the Distribution of Employee Counts

Adjustments to the distribution of no-match employees were accomplished in a similar fashion and are based upon the analysis above.

First, the estimated number of firms for each W-2 level (column four in Exhibit A.3) was multiplied by the corresponding number of W-2 submissions; this produced a preliminary
estimate of the total number of W-2s submitted for all firms for each W-2 level. These figures were then used to construct a distribution that was used to allocate the actual number of employee counts associated with each W-2 class.

An example is presented in the following table to help the reader follow the calculations. The first two columns are taken from Exhibit A.3. The figures in the third column are the products of the first two columns. For example, in the first row 10,563 is equal to 11 * 960. The fourth column converts the numbers in the third column into percentages: $10.8 \%$ is equal to 10,563 divided by 98,143 (the sum of the numbers in the third column representing the total for the $11-19 \mathrm{~W}-2$ size class). Finally, the figures in the fifth column are derived by multiplying the figures in the fourth column by 84,732 (the total number of employees listed on no-match letters sent to employers who submitted 11-19 W-2s: see Exhibit A. 1 above).

| Exhibit A.4 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Number of W- <br> 2s Submitted <br> by Employer | Estimated <br> Number of <br> Firms | Total W-2s <br> (First <br> Estimate) | Percent of <br> W-2s for W-2 <br> Size Class | Number of <br> No-Match <br> Employees | Estimated <br> Average <br> Employment <br> Size |
| 11 | 960 | 10,563 | $10.8 \%$ | 9,120 | 6.9 |
| 12 | 889 | 10,662 | $10.9 \%$ | 9,205 | 7.5 |
| 13 | 827 | 10,754 | $11.0 \%$ | 9,285 | 8.1 |
| 14 | 774 | 10,840 | $11.0 \%$ | 9,359 | 8.7 |
| 15 | 728 | 10,921 | $11.1 \%$ | 9,428 | 9.3 |
| 16 | 687 | 10,997 | $11.2 \%$ | 9,494 | 9.9 |
| 17 | 651 | 11,068 | $11.3 \%$ | 9,556 | 10.6 |
| 18 | 619 | 11,136 | $11.3 \%$ | 9,615 | 11.2 |
| 19 | 590 | 11,201 | $11.4 \%$ | 9,671 | 11.8 |

Note: Estimates may not sum to totals due to rounding.
The estimates of the number of no-match employees were re-aggregated into average employment size classes using the estimated employment levels in the sixth column. Again, the average employment levels were estimated by dividing the numbers in the first column by $1.605(1+60.5 \%$ (the weighted average hire rate)). To compute the number of no-match employees in the 5-9 average employment size class, the first six rows (i.e., rows in which the average employment level is less than 10) of the fifth column were summed. The numbers in the last three rows were than added to the 10-19 average employee size class along with the calculated numbers from the $20-49 \mathrm{~W}-2$ size class. Again, please note that even though the other size classes are not listed above in Exhibit A.4, this calculation was completed for each of employee size groupings.

## Raw Data Received from SSA

Exhibit A. 5 shows the data on no-matches as those data were received from SSA.
Exhibit A. 5

| Size Class <br> Category <br> (Total W-2s) | Total <br> Number <br> Employers | Employers with 0-10 no match ssn's | Employers with 11-19 no match ssn's | Employers with 20-29 no match ssn's | Employers with $30-39$ no match ssn's | Employers <br> with 40-49 <br> no match ssn's | Employers <br> with 50-99 <br> no match ssn's | Employers with 100-149 no match ssn's | Employers with $150-249$ no match ssn's | Employers with 250-499 no match ssn's | Employers with >499 no match ssn's |

## Appendix B: Total Number of Firms by Size Class in U.S. Economy

Data on the number of non-agriculture employer firms by employment size class were obtained from SBA. ${ }^{83}$ The latest year for which this information is available is 2004. Shown below, the data have been divided into 23 different employment size classes. The smallest size class ( 0 employees) was not used in this analysis because the figure includes non-employers as well as start-up firms and firm dissolutions that did not exist in midMarch when the firm's employment level was determined; when they did exist, such firms could have been any size.

| Exhibit B.1: Non-Agriculture Employer Firms for 2004 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Employment Size of <br> Firm | Number of Firms | Percent of Firms | Number of <br> Employees | Employees per <br> Firm |
| $1-4$ | $2,777,680$ | $54.64 \%$ | $5,844,637$ | 2.1 |
| $5-9$ | $1,043,448$ | $20.53 \%$ | $6,852,769$ | 6.6 |
| $10-14$ | 416,466 | $8.19 \%$ | $4,872,276$ | 11.7 |
| $15-19$ | 216,216 | $4.25 \%$ | $3,627,405$ | 16.8 |
| $20-24$ | 133,814 | $2.63 \%$ | $2,920,239$ | 21.8 |
| $25-29$ | 88,635 | $1.74 \%$ | $2,379,155$ | 26.8 |
| $30-34$ | 64,173 | $1.26 \%$ | $2,044,502$ | 31.9 |
| $35-39$ | 47,443 | $0.93 \%$ | $1,749,561$ | 36.9 |
| $40-44$ | 36,787 | $0.72 \%$ | $1,540,881$ | 41.9 |
| $45-49$ | 29,561 | $0.58 \%$ | $1,386,351$ | 46.9 |
| $50-74$ | 85,089 | $1.67 \%$ | $5,121,765$ | 60.2 |
| $75-99$ | 40,853 | $0.80 \%$ | $3,500,160$ | 85.7 |
| $100-149$ | 38,404 | $0.76 \%$ | $4,641,621$ | 120.9 |
| $150-199$ | 18,289 | $0.36 \%$ | $3,141,387$ | 171.8 |
| $200-299$ | 17,259 | $0.34 \%$ | $4,174,222$ | 241.9 |
| $300-399$ | 7,974 | $0.16 \%$ | $2,746,414$ | 344.4 |
| $400-499$ | 4,612 | $0.09 \%$ | $2,054,107$ | 445.4 |
| $500-749$ | 5,695 | $0.11 \%$ | $3,449,491$ | 605.7 |
| $750-999$ | 2,709 | $0.05 \%$ | $2,331,851$ | 860.8 |
| $1,000-1,499$ | 2,828 | $0.06 \%$ | $3,444,427$ | $1,218.0$ |
| $1,500-2,499$ | 2,281 | 0,534 | $0.07 \%$ | $4,396,430$ |
| $2,500+$ | $5,083,750$ | $100 \%$ | $42,855,273$ | $12,126.6$ |
| Sub-Total | $5,885,784$ | $115,074,924$ | 22.6 |  |
| TOTAL |  | $115,074,924$ | 19.6 |  |
|  |  |  |  |  |

[^39]To be able to compare these data with the number of no-match employers provided by SSA, it was necessary to aggregate the above data into the size classes used in this analysis. Again, the employment size classes used in this analysis are as follows:

| Exhibit B.2: <br> Employment Size <br> Classes |
| :---: |
| Number of Employees |
| $5-9$ |
| $10-19$ |
| $20-49$ |
| $50-99$ |
| $100-499$ |
| $500+$ |

The aggregation was straightforward. For example, the number of firms in the 20-49 employment size class was computed by adding the numbers in the $5^{\text {th }}$ through $10^{\text {th }}$ rows of the second column in Exhibit B.1. The results of these aggregation procedures are shown in Exhibit B.3. Note that estimates for the number of farms have been added; detail on how these figures are derived is provided in Appendix D.

| Exhibit B.3: Number of Firms by Employment Size Class |  |  |  |
| :---: | :---: | :---: | :---: |
| Employment Size <br> Class | Number of Non- <br> Agriculture Employer <br> Firms | Number of Farms | Total Number of <br> Firms |
| $5-9$ | $1,043,448$ | 93,972 | $1,137,420$ |
| $10-19$ | 632,682 | 13,187 | 645,869 |
| $20-49$ | 400,413 | 6,594 | 407,007 |
| $50-99$ | 125,942 | 6,594 | 132,536 |
| $100-499$ | 86,538 | 0 | 86,538 |
| $500+$ | 17,047 | 0 | 17,047 |
| TOTALS | $2,306,070$ | 120,346 | $2,426,416$ |

## Appendix C: Estimation of Weighted Average Turnover Rates

This appendix describes the calculations used to construct weighted average labor turnover rates. The first section describes the development of a weighted average hire rate (number of employees hired during the year divided by total employment), whereas the second section presents the construction of a weighted average separation rate (number of voluntary and involuntary employee separations divided by total employment).

## Weighted Average Hire Rates

A weighted average hire rate was used to translate the size categories based on the number of W-2s submitted by an employer into size categories based on average employment size. Information on these translations is presented in Appendix A. Hire rates were also used to estimate the number of affected entities by industry; information on these calculations can be found in Appendix E.

As part of its Job Openings and Labor Turnover Survey (JOLTS) program BLS, publishes monthly and annual hire rates for non-agricultural industries. Shown below, the 2006 average annual hire rates for private industry was estimated to be 48 percent. This rate was considered to be too low for the current analysis, given that many of the most heavily impacted industries appear to have hire rates that exceed the national average. For example, as shown in Exhibit 7, it is estimated that almost 44 percent of the no-match recipients will fall into one of the following four industries: eating and drinking places ( $27.5 \%$ ), special trade contractors ( $7.6 \%$ ), agriculture crop production ( $4.5 \%$ ), and Business Services (4.3\%); at the same time, each of these industries has a hire rate that is considerably larger than the national average. For this reason, a weighted average hire rate was constructed using as weights the distribution of no-match recipients by industry.

| Exhibit C.1: Average Annual Hire Rates for 2006 |  |
| :--- | :---: |
| Ind |  |
| Industry | Rnnul Hire <br> Rate |
| Total Private | $48.0 \%$ |
| Mining and Natural Resources | $37.6 \%$ |
| Construction | $58.7 \%$ |
| Durable Goods Manufacturing | $28.3 \%$ |
| Nondurable Goods Manufacturing | $33.3 \%$ |
| Wholesale Trade | $27.6 \%$ |
| Retail Trade | $58.2 \%$ |
| Transportation and Utilities | $41.9 \%$ |
| Information | $31.9 \%$ |
| Finance and Insurance | $26.0 \%$ |
| Real Estate | $41.4 \%$ |
| Professional and Business Services | $64.5 \%$ |
| Education Services | $28.8 \%$ |
| Health and Social Services | $34.0 \%$ |
| Entertainment | $78.3 \%$ |
| Accommodation and Food Services | $78.7 \%$ |
| Other Services | $38.8 \%$ |
| Agriculture ${ }^{85}$ | $90.0 \%$ |
|  |  |

The industry detail provided by BLS for the hire rates is in some cases at a more aggregate level than the industry codes associated with the distribution of no-match recipients. In these cases, professional judgment was used to match a hire rate with a given industry.

The following table, Exhibit C.2, presents the data and computations used to create the weighted average hire rates. The first two columns show the industries used in the computations and the corresponding percent of no-match letters going to each industry. The fourth column presents the hire rates assigned to each of these industries. Note that the third column contains the BLS industries for which the hire rates were originally computed. In the final column, the second and fourth columns have been multiplied to produce weighted hire rates. For example: in the third row for special trade construction, $4.4 \%$ equals $7.6 \%$ * $58.7 \%$.

The sum of the weighted hire rates is listed in the last column and final row in the table; this $60.5 \%$ figure represents the weighted average hire rate used in the analysis.

[^40]| Exhibit C.2: Development of Weighted Average Hire Rate |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| No-Match Recipients by Industry |  | Industry Hire Rate Used | Hire Rate | Weighted Hire Rate |
| Industry | $\mathrm{Percent}_{86}$ |  |  |  |
| Agriculture ProductionCrops | 4.5\% | Agriculture* | 90.0\% | 4.0\% |
| Eating and Drinking Places | 27.5\% | Accommodation and Food Services | 78.7\% | 21.6\% |
| Construction-Special Trade | 7.6\% | Construction | 58.7\% | 4.4\% |

| Food Stores | 3.7\% | Retail Trade | 58.2\% | 2.2\% |
| Agriculture Services | 1.8\% | Mining and Natural Resources | 37.6\% | 0.7\% |
| Miscellaneous Retail | 2.6\% | Retail Trade | 58.2\% | 1.5\% |
| Building Construction | 1.9\% | Construction | 58.7\% | 1.1\% |
| Personal Services | 1.9\% | Other Services | 38.8\% | 0.8\% |
| Auto Repair, Services, Parking | 1.6\% | Other Services | 38.8\% | 0.6\% |
| Auto Dealers, Gas Stations | 3.3\% | Retail Trade | 58.2\% | 1.9\% |
| Real Estate | 0.9\% | Real Estate | 41.4\% | 0.4\% |
| Durable Goods, Wholesale | 2.1\% | Wholesale Trade | 27.6\% | 0.6\% |
| Social Services | 2.5\% | Health and Social Services | 34.0\% | 0.9\% |
| Engineering, <br> Accounting, Research, <br> Mgmt, and related | 1.1\% | Professional and Business Services | 64.5\% | 0.7\% |
| Non durable Goods, Wholesale | 1.6\% | Wholesale Trade | 27.6\% | 0.4\% |
| Hotels, Lodging Places | 2.5\% | Accommodation and Food Services | 78.7\% | 2.0\% |
| Private Households | 1.5\% | Professional and Business Services | 64.5\% | 1.0\% |
| Motor Freight Transp. and Warehousing | 1.4\% | Transportation and Utilities | 41.9\% | 0.6\% |
| Amusement and Recreation Services | 1.5\% | Entertainment | 78.3\% | 1.2\% |
| Home Furniture \& Equipment Stores | 1.1\% | Retail Trade | 58.2\% | 0.7\% |
| Apparel and Other Finished Products | 1.3\% | Nondurable Goods Manufacturing | 33.3\% | 0.4\% |
| Apparel and Accessory Stores | 1.3\% | Retail Trade | 58.2\% | 0.8\% |
| Legal Services | 0.5\% | Professional and Business Services | 64.5\% | 0.3\% |
| Other | 15.9\% | Total Private | 48.0\% | 7.6\% |
| TOTAL | 100\% |  |  | 60.5\% |

*As noted above, BLS does not publish a hire rate for the agriculture industry. This estimate is based on the highly seasonal nature of the sector.

[^41]
## Weighted Average Separation Rates

A similar procedure was used to develop a weighted average separation rate. This rate was used to estimate the number of no-match employees who will have separated from their employers by the time the no-match letters are received.

As part of its Job Openings and Labor Turnover Survey (JOLTS) program, BLS also publishes monthly and annual employee separation rates for non-agricultural industries. The latest average annual rates for September 2005 through August 2006 are reproduced below.

| Exhibit C.3: <br> BLS Annual Employee Separation Rates by Industry: September <br> 2005 - August 2006 |  |
| :--- | :---: |
| Industry | Annual Employee <br> Separation Rates |
| Mining and Natural Resources | $32.1 \%$ |
| Construction | $61.6 \%$ |
| Durable Goods Manufacturing | $29.4 \%$ |
| Nondurable Goods Manufacturing | $35.4 \%$ |
| Wholesale Trade | $28.6 \%$ |
| Retail Trade | $54.7 \%$ |
| Transportation and Utilities | $39.2 \%$ |
| Information | $30.9 \%$ |
| Finance and Insurance | $27.9 \%$ |
| Real Estate | $38.2 \%$ |
| Professional and Business Services | $53.8 \%$ |
| Education Services | $24.4 \%$ |
| Health Services | $29.7 \%$ |
| Entertainment | $71.6 \%$ |
| Accommodation and Food Services | $76.1 \%$ |
| Other Services | $37.7 \%$ |
| US Average (non agricultural) | $40.4 \%$ |
| Agriculture ${ }^{88}$ | $90.0 \%$ |

The industry detail provided by BLS for the separation rates is in some cases at a more aggregate level than the industry codes associated with the distribution of no-match recipients. In these cases, professional judgment was used to match a separation rate with a given industry.

[^42]The following table presents the data and computations used to create the weighted average separation rates. The first two columns show the industries used in the computations and the corresponding percent of no-match letters going to each industry. The fourth column presents the separation rates assigned to each of these industries. Note that the third column contains the BLS industries for which the hire rates were originally computed. In the final column, the second and fourth columns have been multiplied to produce weighted separation rates. For example: in the third row for special trade construction, $4.7 \%$ equals $7.6 \% * 61.6 \%$.

The sum of the weighted hire rates is listed in the last column and final row in the table; this $57.1 \%$ figure represents the weighted average separation rate used in the analysis.

| Exhibit C.4: Development of Weighted Average Separation Rate |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| No-Match Recipients by Industry |  | Industry Hire Rate Used | Separation Rate | Weighted Rate |
| Industry | $\mathrm{Percent}_{89}$ |  |  |  |
| Agriculture ProductionCrops | 4.5\% | Agriculture* | 90.0\% | 4.0\% |
| Eating and Drinking Places | 27.5\% | Accommodation and Food Services | 76.1\% | 20.9\% |
| Construction-Special Trade | 7.6\% | Construction | 61.6\% | 4.7\% |
| Business Services | 4.3\% | Professional and Business Services | 53.8\% | 2.3\% |
| Health Services | 3.8\% | Health and Social Services | 29.7\% | 1.1\% |
| Food Stores | 3.7\% | Retail Trade | 54.7\% | 2.0\% |
| Agriculture Services | 1.8\% | Mining and Natural Resources | 32.1\% | 0.6\% |
| Miscellaneous Retail | 2.6\% | Retail Trade | 54.7\% | 1.4\% |
| Building Construction | 1.9\% | Construction | 61.6\% | 1.2\% |
| Personal Services | 1.9\% | Other Services | 37.7\% | 0.7\% |
| Auto Repair, Services, Parking | 1.6\% | Other Services | 37.7\% | 0.6\% |
| Auto Dealers, Gas Stations | 3.3\% | Retail Trade | 54.7\% | 1.8\% |
| Real Estate | 0.9\% | Real Estate | 38.2\% | 0.3\% |
| Durable Goods, Wholesale | 2.1\% | Wholesale Trade | 28.6\% | 0.6\% |
| Social Services | 2.5\% | Health and Social Services | 29.7\% | 0.7\% |
| Engineering, Accounting, Research, Mgmt, and related | 1.1\% | Professional and Business Services | 53.8\% | 0.6\% |
| Non durable Goods, Wholesale | 1.6\% | Wholesale Trade | 28.6\% | 0.4\% |
| Hotels, Lodging Places | 2.5\% | Accommodation and Food Services | 76.1\% | 1.9\% |
| Private Households | 1.5\% | Professional and Business Services | 53.8\% | 0.8\% |
| Motor Freight Transp. and Warehousing | 1.4\% | Transportation and Utilities | 39.2\% | 0.6\% |
| Amusement and Recreation Services | 1.5\% | Entertainment | 71.6\% | 1.1\% |
| Home Furniture \& Equipment Stores | 1.1\% | Retail Trade | 54.7\% | 0.6\% |
| Apparel and Other Finished Products | 1.3\% | Nondurable Goods Manufacturing | 35.4\% | 0.4\% |
| Apparel and Accessory Stores | 1.3\% | Retail Trade | 54.7\% | 0.7\% |
| Legal Services | 0.5\% | Professional and Business Services | 53.8\% | 0.3\% |
| Other | 15.9\% | Total Private | 40.4\% | 6.4\% |
| TOTAL | 100\% |  |  | 57.1\% |

*As noted above, BLS does not publish a hire rate for the agriculture industry. This estimate is based on the highly seasonal nature of the sector.

[^43]
## Appendix D: Development of Estimates for the Agriculture Sector

Most of the data used in the small entity impact analysis are drawn from SBA and U.S. Census Bureau sources. These sources do not include information for the agriculture sector. Given that agriculture may be one of the industries heavily impacted by the nomatch rule (see Exhibit 7), it was necessary to locate and incorporate into the analysis data on the agriculture sector. For this purpose, the 2002 Census of Agriculture ${ }^{90}$ served as the main source of data. Various issues of the Farm Labor report were also utilized. ${ }^{91}$

Exhibit D. 1 shows the data from the Census of Agriculture that were used in the analysis, which reflect only farms that utilize hired workers. According to the 2002 Census, there are more than 2 million farms in the United States, of which only 26 percent (554,434 / $2,128,982$ ) utilize hired labor. Many farmers rely upon contract labor instead of hired labor, and do not submit W-2s for those workers.

| Exhibit D.1: Agriculture Data from 2002 Census of Agriculture, Table 56 |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
|  | Farms with Hired Workers |  | All Farms |  |  |
| Market Value of <br> Agriculture Products Sold | Farms <br> (Number) | Workers <br> (Number) | Workers <br> per Farm |  |  |
| Less than $\$ 1,000$ | 61,605 | 157,085 | 2.5 | Average <br> Receipts* <br> per Farm (\$) | Number of <br> Farms <br> (\% of Total) |
| $\$ 1,000$ to $\$ 2,499$ | 29,703 | 69,258 | 2.3 | 1,521 | $27 \%$ |
| $\$ 2,500$ to $\$ 4,999$ | 31,427 | 83,228 | 2.6 | 1,813 | $12 \%$ |
| $\$ 5,000$ to $\$ 9,999$ | 40,606 | 114,707 | 2.8 | 3,863 | $10 \%$ |
| $\$ 10,000$ to $\$ 24,999$ | 63,800 | 204,951 | 3.2 | 16,892 | $11 \%$ |
| $\$ 25,000$ to $\$ 49999$ | 52,843 | 181,358 | 3.4 | 37,743 | $12 \%$ |
| $\$ 50,000$ to $\$ 99,999$ | 60,643 | 238,282 | 3.9 | 75,936 | $7 \%$ |

*Includes market value of agriculture products sold and government payments.
${ }^{\dagger}$ The figures in this column were computed using the data in columns two and three.
To utilize these data, it was necessary to transform many of the specific elements so that they would be compatible with data from other sources used in the analysis. This appendix describes the various interpolations, computations, and statistical analyses that were used to make the necessary adjustments. The main objective was to tabulate by

[^44]employment size class the number of farms with hired workers, the number of hired workers, and revenues.

The average number of workers per farm in Exhibit D.1, column 4, was used to compute the number of farms and number of workers for the first two employment size classes (14 employees, and 5-9 employees in Exhibit D.6). For example, the number of farms for the 1-4 employee size class was calculated by summing the first seven rows of data in the second column.

Only one row of data was available for the sizes classes with more than 10 employees: the row shows an average of 34.6 workers per farm. It was assumed that the data in this row cover the following three employment size classes: 10-19 employees, 20-49 employees, and 50-99 employees. As described below, procedures were developed and used to allocate the figures in this row ( 26,374 farms and 912,417 workers) to these three employment size classes. Allocation to all five additional size classes (which would have included 100-499 employees and 500+ employees) was not pursued for two reasons. First, the number of farms in the last row represents less than 5 percent of the total number of farms with hired workers; since the percentage of farms decreases with farm size, it is believed that anything allocated to the two largest employment size classes would have been negligible. Along these lines, the average of 34.6 workers per farm was considered to be too low to warrant any allocations to classes with more than 100 employees.

The allocation of the 26,374 farms to the three employment size classes was accomplished using the following assumptions. Fifty percent of these farms were assigned to the 10-19 employee size class; 25 percent was assigned both to the 20-49 employee size class and to the $50-99$ employee size class. The selection of the percentages was based on several factors. First, the percentage of firms generally falls as firm size increases. However, the 50-99 employee size class is larger than the 20-49 employee size class; these two observations provide some justification for assigning equal percentages to the $20-49$ and $50-99$ employee size classes. In addition, the allocation based on the percentages produced average worker per farm ratios that fell within the designated size classes.

The allocation of the 912,417 employees to the three employment size classes was accomplished using data from the Farm Labor report. ${ }^{92}$ These data, presented in Exhibit D.2, show the percentage of hired workers employed on farms of different employee size classes. The data are based on surveys conducted in the continental United States during the months and years shown. The survey includes both field and livestock workers but excludes agricultural service workers.

[^45]| Workers per Farm | Exhibit D.2: Percent of Hired Workers |  |  |  |  |  |  |  |  |  |  |

| $21-50$ | $14 \%$ | $25.2 \%$ | $20-49$ | 230,205 |
| $51+$ | $30 \%$ | $54.3 \%$ | $50-99$ | 495,696 |
| Total | $55 \%$ | $100 \%$ |  | 912,417 |

*Categories reported in the Farm Labor report.
**Size classes used in this analysis.
For the 10-19 employee size class, $11 \%$ was divided by $55 \%$, producing the calibrated percentage of $20.4 \%$, which was then multiplied by 912,417 . The result is 186,516 workers. Although there is not a direct correspondence between the employment sizes in the Farm Labor report and those used in this analysis, they were considered to be close enough to be used without any further adjustments.

Estimates of revenues per farm by employee size class were developed using regression analysis. The analysis consisted of relating average receipts per farm (column 5 in Exhibit D. 1 above) to average workers per farm (column 4 in Exhibit D.1). As can be seen in the following two graphs, a change in the relationship between these two variables occurs around four workers per farm. The first graph exhibits a polynomial trend for farms that hire 1-4 workers; in the second graph, on the other hand, a linear relationship is depicted for farms that hire more than 4 workers. If there had not been a change in trend, we would have employed a single regression based on all the data points even though some of those points lie outside our range of analysis (i.e., farms with less than 5 employees). There are only four categories in Exhibit D. 1 that show more than 4 employees; to discard all the other categories means excluding over 60 percent of the possible data points that could be used to decipher the overall relationship between the
two variables. Nonetheless, given the change in the trend, we believed it was appropriate to exclude those points and use the relationship evident in the second graph (Exhibit D.5)

Exhibit D.4:

Exhibit D.5:

The relationship in Exhibit D. 5 can be defined as the following equation for farms that utilize more than four hired workers:

$$
\text { ReceiptsperFarm = -263,592 + (104,467 * NumberofHiredWorkersperFarm }) .
$$

The intercept and slope coefficients in this linear relationship were estimated in a regression analysis using Ordinary Least Squares (OLS). The data used to estimate the regression are in the 8th through 11th rows of data in Exhibit D.1, columns 4 and 5. The specified equation has a very strong fit with the data, demonstrated by an $\mathrm{R}^{2}$ of 0.9998 .

Estimates of average receipts by employee size class were generated by applying workers-per-farm estimates to the regression equations and coefficients. These calculations are shown in Exhibit D.6, which also incorporates the number of farms and number of workers that were estimated above. In the second row of data, 672,192 (the total number of workers for the size class) is divided by 93,972 (the total number of farms with hired workers for the size class) to estimate the average number of hired workers per farm for the $5-9$ employee size class; the result is 7.2 . This average is then used as the independent variable (i.e., "x") in the linear regression above to estimate the average receipts per farm for the $5-9$ employee size class. The result is 483,671 , which is equal to $(104,467 * 7.2)$ minus 263,592 . Finally, total receipts for the category $(45,451,516,663)$ are computed as the product of the average receipts per farm $(483,671)$ and the number of farms $(434,088)$.

| Employee <br> Size Class |  |  |  |  |  |  |  | Farms with Hired Workers | Number of <br> Workers | Workers <br> per Farm | Average <br> Receipts <br> per Farm <br> (\$) | Total Receipts <br> (\$) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $1-4$ | 434,088 | $78 \%$ | $1,451,861$ | 3.3 | 28,782 | $12,493,835,510$ |  |  |  |  |  |  |
| $5-9$ | 93,972 | $17 \%$ | 672,192 | 7.2 | 483,671 | $45,451,516,663$ |  |  |  |  |  |
| $10-19$ | 13,187 | $2 \%$ | 186,516 | 14.1 | $1,213,981$ | $16,008,771,138$ |  |  |  |  |  |  |
| $20-49$ | 6,594 | $1 \%$ | 230,205 | 34.9 | $3,383,751$ | $22,310,762,480$ |  |  |  |  |  |  |
| $50-99$ | 6,594 | $1 \%$ | 495,696 | 75.2 | $7,590,176$ | $50,045,824,467$ |  |  |  |  |  |  |
| Totals | 554,434 | $100 \%$ | $3,036,470$ | 5.5 | 308,542 | $146,310,710,257$ |  |  |  |  |  |  |

## Appendix E: Number of Affected Entities by Industry

The calculations presented in this appendix were used to estimate impacts by industry. The entire process can be summarized as follows. A tabulation of employers with wage items in the ESF was obtained from GAO; shown below in Exhibit E.1, the tabulation provided the number of employers for 25 industries, which accounted for 87.5 percent of the 1.8 million employers in the sample. For each one of these industries, additional data sources were used to estimate the percentage of employers eligible to receive a no-match letter (i.e., could have more than 10 unique $\mathrm{W}-2 \mathrm{~s}$ in the ESF). Multiplying GAO's number of employers by these percentages produced estimates of the number of employers in the sample who could potentially receive a no-match letter. These numbers were then converted into the percent of eligible employers accounted for by each industry.

| Exhibit E.1: Employers with Wage Items in ESF by Industry |  |  |
| :---: | :---: | :---: |
| Industry | SIC Code | Number of Employers |
| Agriculture Production-Crops | 01 | 123,805 |

* "OP Bldr" means Operative Builder.
** Personal Services include laundry, carpet cleaning, photo studios, beauty shops, shoe repair, funeral services, tax and other miscellaneous personal services.
*** Full listing also includes Engineering, Architecture, Research, Management-Related Services.

## Use of BLS Annual Hire Rates to Estimate Revised Employment Thresholds

Employment size class data generally refer to levels of employment at particular points in time-for example, some sources measure employment levels at mid-March. While these types of data are needed to estimate impacts by industry, they do not correspond to the employment data in the ESF, from which the no-match letters are derived. The employment levels in the ESF reflect the total number of W-2s that employers submit during the year. Employers must submit more than $10 \mathrm{~W}-2 \mathrm{~s}$ that do not match SSA records in order to receive a no-match letter.

The number of $\mathrm{W}-2 \mathrm{~s}$ submitted depends not only on the average employment level throughout the year, but also on the labor turnover rate. This means that small companies with less than 10 employees on staff at any given time could receive a no-match letter if the company has a high turnover rate.

To be able to use the employment size class data, it was necessary to develop a translation between average employment level and the number of W-2s submitted. This translation is based on the following: it was assumed that the number of W-2s submitted equals the average employment level plus the number of people who are hired throughout the year. BLS publishes annual industry hire rates that can be used to estimate the number of hires throughout the year (the hire rate multiplied by total employment equals the number of hires). The following formulas, therefore, can be used to summarize the relationship between employment levels and the number of W-2s.

$$
\begin{aligned}
& \mathrm{W} 2=\mathrm{E}+\mathrm{H} \\
& \mathrm{H}=\mathrm{R} * \mathrm{E} \\
& \mathrm{~W} 2=\mathrm{E} *(1+\mathrm{R}),
\end{aligned}
$$

Where E refers to employment, H refers to the number of hires, and R means the hire rate.

Setting the number of $\mathrm{W}-2$ s equal to 11 and solving for E results in an employment size threshold. This threshold represents the minimum average annual employment level needed in order for a company to be large enough to receive a no-match letter. Given its labor turnover rate, a company as large as this threshold could receive a no-match letter if 100 percent of its W-2s do not match SSA records.

The following table provides the annual hires and estimated employment thresholds used in the analysis. These thresholds are used in the following sections to help adjust the number of employers in Exhibit E. 1

| Exhibit E.2: Annual Hire Rates and Employment Thresholds |  |  |
| :--- | :---: | :---: |
| Industry | Annual Hire <br> Rate $^{93}$ | Employment <br> Threshold |
| Total Private | $48.0 \%$ | 7 |
| Mining and Natural Resources | $37.6 \%$ | 8 |
| Construction | $58.7 \%$ | 7 |
| Durable Goods Manufacturing | $28.3 \%$ | 9 |
| Nondurable Goods Manufacturing | $33.3 \%$ | 8 |
| Wholesale Trade | $27.6 \%$ | 9 |
| Retail Trade | $58.2 \%$ | 7 |
| Transportation and Utilities | $41.9 \%$ | 8 |
| Information | $31.9 \%$ | 8 |
| Finance and Insurance | $26.0 \%$ | 9 |
| Real Estate | $64.4 \%$ | 8 |
| Professional and Business Services | $28.5 \%$ | 7 |
| Education Services | $34.0 \%$ | 9 |
| Health and Social Services | $78.3 \%$ | 8 |
| Entertainment | $78.7 \%$ | 6 |
| Accommodation and Food Services | $38.8 \%$ | 6 |
| Other Services | $90.0 \%$ | 8 |
| Agriculture* | 6 |  |

* BLS does not provide labor turnover information for the agriculture industry. This estimate is based on professional judgment.

## Use of County Business Patterns and Regression Analysis to Estimate the Number of Companies Larger than the Employment Threshold

An industry with a large percentage of very small companies (e.g., only 1-4 employees) probably will not receive the same number of no-match letters as an industry of the same size but which has fewer small companies. This section provides detail on the calculations that were used to account for differences in size class as well as estimates the number of companies larger than their industry's employment threshold (as defined above).

County Business Patterns (CBP), published by the U.S. Census Bureau, is the most comprehensive source of industry data on employment size class. Data include the number of establishments and the number of employees for nine different employment size classes. These data were used to estimate the percentage of each industry's establishments that are larger than the employment threshold.

As shown in Exhibit E. 2 above, all the employment thresholds range between 6 and 9 employees. These values fall within the CBP employment size class of 5-9 employees.

[^46]The following procedures allocate the number of CBP establishments in the 5-9 employee size class to the five constituent employment levels: 5, 6, 7, 8, and 9 employees. The number of establishments greater than or equal to the employment threshold were then summed and divided by the total number of establishments in the industry. The resulting figures represent the percentage of each industry's firms that potentially could receive a no-match letter.

Applying these industry percentages to the number of corresponding firms in the GAO sample produces industry estimates of the number of firms in that sample that are large enough to receive a no-match letter. These results are then placed on a percentage basis by dividing them by the total number of firms in the sample that are large enough to receive a no-match letter.

## Disaggregation of CBP Establishments in the 5-9 Employee Size Class

For each industry, regression analysis was used to allocate the number of CBP establishments in the 5-9 employee size class to specific employment levels. The regressions consisted of relating the percentage of establishments to the average number of employees per establishment, where each observation was defined by the employment size class. All estimations were based on the following functional specification:

$$
\mathrm{Y}=\mathrm{A} * \mathrm{X}^{\mathrm{b}}
$$

where Y refers to the percentage of the total number of establishments, X refers to the average number of employees per establishment, and $A$ and $b$ are the estimated regression coefficients that define each specific curve. The data for the regressions are presented in Exhibit E.3. Exhibits E. 4 and E. 5 contain the raw CBP data that were used to construct the regression variables in Exhibit E. 3

Exhibit E. 6 provides the results of the regression analyses. With two exceptions, all of the regressions are based on six observations covering size classes 1-4 employees through 100-249 employees. Much of the data for the larger size classes was missing, and was not really needed because the regressions are being used primarily as an interpolation procedure for the 5-9 employee size class. NAICS 453 is based on 5 observations, and NAICS 315 is based on 6 observations, but for size classes 5-9 employees through 250499 employees.

Coefficients for the regressions were used to produce predicted values (percent of total establishments) for each specific employment level in the 5-9 employment size class (i.e., $5,6,7,8$, and 9 ). The predicted values were then calibrated so that they would sum to 100 percent. A table with these percentages is provided in Exhibit E.7.

The calibrated percentages in Exhibit E. 7 were then used to allocate the total number of establishments in the 5-9 employment size class to specific employment levels (e.g., 5 employees, 6 employees, etc.). This distribution is shown in Exhibit E.8. The last two columns in Exhibit E. 8 contain two redefined size categories based on the employment thresholds presented in Exhibit E.2. The first size category contains the number of
establishments in the 5-9 employment size class that fall below the employment threshold. The second category presents those establishments in the 5-9 employment size class that are larger than or equal to the size threshold.

The percentage of each industry's establishments larger than or equal to the employment size threshold was then estimated using the data in the final column in Exhibit E. 8 and the data in Exhibit E.3. For each industry, the last seven columns in Exhibit E. 3 were summed and then added to the last column in Exhibit E.8; the resulting figure was then divided by the total number of establishments in the industry (column 3 in Exhibit E.3). The resulting percentages are presented in Exhibit E.9.

Applying these percentages to the number of employers in the ESF (shown in Exhibit E.1) produced an estimate of the number of firms eligible to receive a no-match letter. These calculations are shown in Exhibit E.9.

# Appendix F: Review of Studies Regarding Labor Force Participation of Unauthorized Workers 

## April 2005 SSA OIG Report

The Social Security Administration's (SSA) Office of the Inspector General (OIG) conducted an analysis of the tax years 1999-2001 wage items in the Earnings Suspense File (EFS) for 300 employers that were evenly divided between the agriculture, restaurants, and service industries. ${ }^{94}$ Those employers represent the 100 firms in each industry that contributed the most records to the ESF over the 3-year period. The data included more than 2.7 million ESF wage items, and the reason for each item's inclusion in the ESF was noted.

Exhibit F. 1 presents the distribution of the reporting irregularities in this sample of ESF records. The first seven categories of reporting regularities in the exhibit account for approximately 25 percent of the wage items that involve an invalid SSN. ${ }^{95}$ Although these invalid SSNs cannot all be assigned to unauthorized workers, unauthorized workers probably comprise a large percentage of the invalid SSNs that were used. ${ }^{96}$ Valid SSNs with name mismatches may include some unauthorized workers as well. Based on this information, it can be assumed that unauthorized workers account for at least 20 percent of the ESF wage items in this sample.

| Exhibit F.1: Distribution of Reporting Irregularities in EFS Sample |  |  |
| :--- | ---: | ---: |
| Reporting Irregularity | Number | Percent |
| SSN with all zeros | 30,269 | $1.1 \%$ |
| SSN with all nines | 1,227 | $0.0 \%$ |
| SSN with area number 666 | 781 | $0.0 \%$ |
| SSN with area number 773-999 | 15,554 | $0.6 \%$ |
| Unassigned SSNs | 631,883 | $22.9 \%$ |
| Valid SSNs assigned to young children | 9,469 | $0.3 \%$ |
| Valid SSNS assigned to deceased individuals | 5,352 | $0.2 \%$ |
| Valid SSNs with name mismatches | $2,066,230$ | $74.8 \%$ |
| TOTAL | $2,760,765$ | $100.0 \%$ |

[^47]Exhibit F. 2 compares the number of wage items posted to ESF with the total number of $\mathrm{W}-2 \mathrm{~s}$ submitted by these companies. The exhibit depicts a wide range among the industries and considerable variation within each industry. On average, 14 percent of the total W-2 submissions were posted to the ESF, whereas the median employer percentage was 32 percent. Agriculture contributed the largest percentage of its W-2s to the ESF ( $48 \%$ ), followed by Services (13\%) and Restaurants (11\%). At least one employer had up to 93 percent of its W-2s posted to the ESF, whereas at least one other employer only had 1 percent of its W-2s that did not match SSA records.

Exhibit F.2:

| Industry | Number of <br> W-2s <br> Submitted | Number of <br> ESF Items | Percent of <br> W-2s <br> Posted to <br> the ESF | Median <br> Employer <br> Percentage |  | Range of Employer <br> Percentages |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 13 | 30 | 1 | Low |  |
| Service | $8,920,746$ | $1,132,070$ | 13 |  |  |  |  |
| Restaurant | $9,061,420$ | $1,026,620$ | 11 | 15 | 2 | 70 |  |
| Agriculture | $1,264,716$ | 602,075 | 48 | 68 | 3 | 85 |  |
| Total | $19,246,882$ | $2,760,765$ | 14 | 32 | 1 | 93 |  |

In conjunction with other data, the figures in column 4 can be used to derive the percentage of ESF postings that can be attributed to unauthorized workers. In Exhibit F.2, the number of ESF postings in column 3 is a product of the total number of W-2s submitted (column 2) and the percent of W-2s posted to the ESF (column 4), or

$$
\mathrm{ESF}=\mathrm{ESFPercent} * \mathrm{~W} 2,
$$

where "ESF" is the number of postings to the ESF, "W2" is the total number of W-2s submitted, and ESFPercent is the number of ESF items divided by the total W-2 submissions.

Exhibit F. 4 below presents estimates from the Pew Hispanic Center on the percentage of industry labor forces comprised by unauthorized workers. These labor-force percentages can be used in the following equation to estimate the number of unauthorized workers:

$$
\mathrm{U}=\text { UnauthorizedLFPercent } * \mathrm{E},
$$

where "U" is the number of unauthorized workers in the industry, " $E$ " is the total industry labor force, and UnauthorizedLFPercent is the number of unauthorized workers divided by the total labor force.

If we assume that all unauthorized workers are employed by firms that submit $\mathrm{W}-2 \mathrm{~s}$ for their work, unauthorized workers would comprise the following percentage of ESF postings:

$$
\mathrm{U} / \mathrm{ESF}=(\text { UnauthorizedLFPercent / ESFPercent }) *(\mathrm{E} / \mathrm{W} 2) .
$$

In Appendix A, we saw that the number of W2s submitted by an employer is a function of the size of the labor force and the number of new hires. As previously shown, this relationship can be stated as

$$
\mathrm{W} 2=\mathrm{E} *(1+\mathrm{R}),
$$

where " $R$ " is the hire rate. Substituting the right side of this expression into the previous equation produces the following:

$$
\mathrm{U} / \mathrm{ESF}=(\text { UnauthorizedLFPercent } / \mathrm{ESFPercent}) /(1+\mathrm{R})
$$

Exhibit F. 3 uses the relevant percentages from Exhibits F.2, F.4, and C. 1 to estimate the ratio presented in the above equation, the results of which are shown in column 5. Because some unauthorized workers do not have W-2s submitted for their employment, these estimates should be considered upper bounds. Also, we do not have any information on rates for other industries, but suspect they would be lower than those displayed in Exhibit F.3.

Exhibit F.3:

| Industry | ESFPercent | UnauthorizedLFPercent | Hire Rate | U / ESF |
| :--- | :---: | :---: | :---: | :---: |
| Service | $13 \%$ | $11 \%$ | $45.1 \%^{97}$ | $58 \%$ |
| Restaurant | $11 \%$ | $12 \%$ | $78.7 \%$ | $61 \%$ |
| Agriculture | $48 \%$ | $53 \%$ | $90 \%$ | $58 \%$ |

## February 2005 GAO Report

In February 2005, GAO released an analysis of 84.6 millions ESF wage items, covering tax years 1985 to $2000 .{ }^{98}$ The report addresses different types of information that are somewhat related to the number of unauthorized workers in the ESF. One analysis looked at 295 SSNs, of which each had at least 1,000 wage items posted to the ESF over the period. Since 1937, SSA has reinstated 13.1 million ESF wage items associated with these 295 SSNs. ${ }^{99}$ These reinstatements were given to 11.7 million different persons, of whom 10.5 million ( 90 percent) were born in the United States and 10 percent were born in other countries. Since 1985 the percentage of reinstatement recipients who were foreign-born has leveled off at approximately 18 percent. ${ }^{100}$ Further analysis of the data indicates that approximately 52 percent of the reinstatements to foreign-born individuals

[^48]will have had earnings in the ESF before they receive a SSN. ${ }^{101}$ This implies that roughly 9 percent $(52 \% * 18 \%)$ of the reinstatement recipients will have had unauthorized earnings at some time in the past.

Although seemingly relevant, it is difficult to use this information to gauge the extent of unauthorized workers in the ESF (which might shed some light on the number of unauthorized workers affected by the no-match letters). For example, foreign-born reinstatement recipients include both U.S. citizens and authorized non-citizens in addition to unauthorized workers. Furthermore, the percentage of recipients who were unauthorized at some point in the past ( 9 percent) only reflects non-citizens who eventually obtained a SSN; it does not address unauthorized workers in the ESF who never obtained a SSN or a work permit.

The reinstatement data are also difficult to utilize. While there were 13.1 million reinstatements associated with these 295 SSNs over the past 70 years, 9.6 million records still remain in the ESF because the employees could not be identified. Expressing these numbers in percentages shows that SSA was able to reinstate 58 percent of the ESF postings for these 295 SSNs , while 42 percent of those postings remain unsolved. Although we do not know the extent to which the unsolved posting are associated with different individuals, the 13.1 million reinstatements were assigned to individuals on nearly a one-for-one basis. ${ }^{102}$ If we assume that the remaining 9.6 million records in the ESF are similarly dispersed to individuals and are all associated with unauthorized workers, 42 percent is an estimate of the percentage of workers associated with the 295 SSNs who could be unauthorized. This figure could be higher or lower depending on a number of other factors that are unknown. For example, 42 percent is an average based on the total reinstatements over a 70 year period. However, if the ratio of authorized to unauthorized workers in the ESF has been trending upward or downward over time, the 42-percent figure will underestimate or overestimate the actual percentage for the most recent years. This study provided no data on a year-by-year trend in reinstatements, and we cannot predict the ratio of authorized to unauthorized workers in a given tax year on the basis of historical reinstatement totals over a 70-year period.

## Pew Hispanic Center Report

The Pew Center has reported several estimates of the proportion of the labor force that is comprised of unauthorized workers. For example, Pew estimated there are 7.2 million unauthorized migrant workers in the United States, accounting for 4.9 percent of the total civilian labor force. ${ }^{103}$ In the same report, the Pew Center provides similar estimates for different industries, which are reproduced in Exhibit F.4.

[^49]| Exhibit F.4: Proportion of Each Industry's Labor <br> Force Which Is Unauthorized  <br> Industry  Percent |  |
| :--- | :---: |
| Private Households | $21 \%$ |
| Food Manufacturing | $14 \%$ |
| Agriculture ${ }^{104}$ | $13 \%$ |
| Furniture Manufacturing | $13 \%$ |
| Construction | $12 \%$ |
| Textiles Manufacturing | $12 \%$ |
| Food Services | $12 \%$ |
| Admin. \& Support Services | $11 \%$ |
| Accommodations | $10 \%$ |
| Other Manufacturing | $6 \%$ |

To some extent, the figures in Exhibit F. 4 represent lower bounds for the average industry percentages of ESF postings that can be attributed to unauthorized workers. In other words, the number of unauthorized workers divided by an industry's total labor force has to be less than the number of unauthorized workers divided by the number of workers with ESF postings. However, the numbers in Exhibit F. 4 do not take into account the percentage of unauthorized workers who are employed on legitimate payrolls versus those who work in the underground economy. To the extent that the above percentages reflect all unauthorized workers, the percentages will be higher than average industry percentages based only on employers with legitimate payrolls.

## Center for Urban Economic Development, University of Illinois at Chicago Report, November $2003{ }^{105}$

The purpose of this report was to determine how no-match letters impact labor markets and immigration enforcement efforts. In the summer of 2003, the authors surveyed a non-random sample of workers (921) listed on no-match letters; these letters were sent to 342 employers in 18 States. Other sources of information were also reviewed, including an SSA OIG audit released in November 2002. According to the audit that was reviewed, less than 2 percent of the corrections to SSA records stem from employers' corrections of their W-2s. The authors therefore conclude that "the no-match letter
but who is not a U.S. citizen, has not been admitted for permanent residence, and is not in a set of specific authorized temporary statuses permitting longer-term residence and work."
${ }^{104}$ In a separate Pew Center paper, it is estimated that approximately 48 percent of the agriculture labor force is unauthorized. This number includes both crop workers and livestock workers and is based on a 58percent rate for crop workers. See Pew Hispanic Center, B. Lindsay Lowell and Roberto Suro, How Many Undocumented: the Numbers Behind the U.S. - Mexican Migration Talks, March 21, 2002. According to USDA's National Agriculture Workers Survey, 53 percent of the hired crop labor force lacked work authorization in 2001-2002, down from 55 percent in 1999-2000. USDA, National Agriculture Workers Survey, December 12, 2007.
${ }^{105}$ Chirag Mehta, Nik Theodore and Marielena Hincapie, Center for Urban Economic Development, University of Illinois at Chicago, Social Security Administration's No-Match Letter Program: Implications for Immigration Enforcement and Workers' Rights, November 2003.
program will not produce a substantial number of corrections to wage items in the ESF and argue that the no-match letter program is ineffective as a tool for reducing the ESF."

At the time of the study, employers did not have the same incentives to follow up on nomatch letters as they would have under the no-match rule. If employers become more attentive to their no-match letters, which we assume will be the case, it is likely that W-2 corrections will become a larger share of the ESF reinstatements. For this reason, it is believed that employers will be able to resolve a greater percentage of their no-matches than the 2 percent indicated in SSA's OIG audit in 2002.

While the authors of the Center for Urban Economic Development report do not argue that the low rate of reinstatements from the no-match program demonstrates that a correspondingly high ratio of no-matched employees are unauthorized aliens, they nevertheless assert that "most workers with unmatched SSNs are undocumented immigrants," and seek to support this inference by noting parallel growth in illegal immigration and in the ESF, as well as correlations between the State-by-State distribution of no-match letters and States' illegal immigrant populations.

## Appendix G: Computation of Weighted Average Wage Rates

As noted in the report, the cost analysis depends upon hourly wage rates for the following occupations:

- Lawyer
- Accountant
- Compensation and Benefits Manager
- Compensation, Benefits, and Employment Specialist
- Human Resources Assistant

For each of these occupations, average hourly wage estimates by State were obtained from the U.S. Bureau of Labor Statistics (BLS). ${ }^{106}$ A weighted average of these State wages was then developed by using as weights the percentage of no-match letters to be sent to each State for TY 2006. ${ }^{107}$

In addition, it was necessary to capture the value of lost time for any employee listed on a no-match letter. Since employees listed on no-match letters span the gamut of occupations, an average labor rate across all occupations was used for this purpose. For each State, a single average wage representing all occupations was obtained from the same BLS source listed below; these wages were then weighted by the percentage of nomatch letters to be sent to each State for TY 2006. The sum of the weighted wages produced the weighted average wage rate used in the analysis.

Exhibit G. 1 presents the data and computations used to create the weighted average wage rates that were used. The third column in the table, the percentage of no-match letters sent to each State, contains the weights for the occupations that are listed. These percentages are multiplied by the corresponding average hourly State wage to produce a weighted wage. For example: for California, the weighted wage for a lawyer is calculated as $25.6 \%$ * 63.78 ; the weighted wage for an accountant in California is calculated as $25.6 \%$ * 30.96. The sums of the weighted wages are listed in the final row in the table; these figures are the weighted average wage rates used in the analysis.

## Appendix H: Calculation of Accounting Costs

The accounting costs are calculated by multiplying the average wage rate for an accountant by the estimated number of hours it will take an accountant to perform required functions under the rule. As shown in Exhibit 14, $\$ 41.52$ is the loaded average hourly wage rate assumed for an accountant. The amount of time spent by an accountant is calculated as the total number of hours spent on two separate accounting activities: completing the W-2c form and completing the W-3c form. The variables used to compute the number of hours for each of these activities is specified below.

## Completion of W-2c Form

The number of hours spent completing W-2c forms is a product of the number of authorized no-match employees (who are assumed to have their no-matches resolved) and an estimate of the amount of time it will take to complete a form for one individual.

Length of Time: 0.25 Hours<br>Number of Employees: Total Number of Authorized Employees (Exhibit 13)

The number of authorized no-match employees in Exhibit 13 is presented both by size class and the percentage of no-match employees assumed to be unauthorized.

## Completion of W-3c Form

The total amount of time involved in completing $\mathrm{W}-3 \mathrm{c}$ forms is not a function of the number of no-match employees. Rather, it is assumed that each firm that receives a nomatch letter will complete and submit one W-3c form, which will require a half hour of an accountant's time. The calculations are presented in the following table. The numbers in the third column are equal to the corresponding figures in the second column * 0.5 hours. The fourth column simply multiplies the third column by $\$ 41.52$, the accountant wage rate.

| Exhibit H.1: Estimated Cost for Completing W-3c Forms |  |  |  |
| :---: | :---: | :---: | :---: |
| Employment <br> Size Class | Number of No-Match <br> Employers | Number of Hours Spent <br> Completing W-3c Forms | Total Cost to Complete <br> W-3c Forms |
| $5-9$ | 4,866 | 2,433 | 101,024 |
| $10-19$ | 24,840 | 12,420 | 515,741 |
| $20-49$ | 46,102 | 23,051 | 957,187 |
| $50-99$ | 23,286 | 11,643 | 483,469 |
| $100-499$ | 33,653 | 16,827 | 698,719 |
| $500+$ | 8,088 | 4,044 | 167,931 |

## Appendix I: Calculation of Human Resources Labor Costs

Human Resources (HR) labor costs involve the following activities: writing form letters, checking and reviewing payroll records and employee files, contacting employees about their no-match status, meeting with employees about their no-match status, and providing other assistance to help no-match employees resolve their status. For each of these activities, the cost estimates rely upon assumptions about the allocation of duties among different types of HR personnel. The types of HR personnel distinguished in the analysis are compensation and benefits managers, compensation/benefits/employment specialists, and HR assistants. For each activity and occupation, costs estimates are a function of the wage rate (shown in Exhibit 14) and the amount of time spent conducting the activity. In most cases, the amount of time spent on the activity depends on the number of no-match employees affected.

## Form Letters

The total amount of time writing form letters is not a function of the number of no-match employees. Rather, it is assumed that each firm that receives a no-match letter will write several different form letters to use when communicating with affected employees and various government agencies. Writing the form letters will require 45 minutes split among the Compensation and Benefits Manager (15 minutes) and the Compensation/Benefits/Employment Specialist (30 minutes). The cost per employer of writing form letters is $\$ 32.93$ ( 15 minutes at $\$ 57.28$ per hour for the Manager, plus 30 minutes at $\$ 37.23$ per hour for the Specialist). The calculations are presented in Exhibit I.1. The numbers in the third column are equal to the corresponding figures in the second column multiplied by 0.75 hours, to determine the total amount of time. The fourth column multiplies the second column by $\$ 32.93$, the cost per employer to write the form letters.

| Exhibit I.1: Estimated Cost for Writing Form Letters |  |  |  |
| :---: | :---: | :---: | :---: |
| Employment Size <br> Class | Number of No-Match <br> Employers | Number of Hours Spent <br> Writing Form Letters | Total Cost to Write Form <br> Letters |
| $5-9$ | 4,866 | 3,650 | $\$ 160,237$ |
| $10-19$ | 24,840 | 18,630 | $\$ 817,981$ |
| $20-49$ | 46,102 | 34,577 | $\$ 1,518,139$ |
| $50-99$ | 23,286 | 17,465 | $\$ 766,808$ |
| $100-499$ | 33,653 | 25,240 | $\$ 1,108,193$ |
| $500+$ | 8,088 | 6,066 | $\$ 266,338$ |

## Identification of Employees Listed on the No-Match Letter

Each employer that receives a no-match letter must determine whether employees identified on the list are still working for the company. The employer will generate a list of all current employees (including name and SSN) at a cost of $\$ 175$. Comparing the list
to the no-match letter will take 15 minutes of an HR Assistant's time. The labor cost per employer of identifying employees listed on the no-match letter is $\$ 6.09$ ( 15 minutes at $\$ 24.34$ per hour for the HR Assistant). The total cost per employer is $\$ 181.09$. The calculations are presented in Exhibit I.2. The numbers in the third column are equal to the corresponding figures in the second column multiplied by 0.25 hours. The fourth column multiplies the second column by $\$ 181.09$, the cost per employer to identify employees listed on the no-match letter.

| Exhibit I.2: Estimated Cost for Identifying Employees Listed on the No-Match Letter |  |  |  |
| :---: | :---: | :---: | :---: |
| Employment Size <br> Class | Number of No-Match <br> Employers | Number of Hours <br> Spent Identifying <br> Employees | Total Cost to Identify <br> Employees |
| $5-9$ | 4,866 | 1,217 | $\$ 881,184$ |
| $10-19$ | 24,840 | 6,210 | $\$ 4,498,276$ |
| $20-49$ | 46,102 | 11,526 | $\$ 8,348,611$ |
| $50-99$ | 23,286 | 5,822 | $\$ 4,216,862$ |
| $100-499$ | 33,653 | 8,413 | $\$ 6,094,222$ |
| $500+$ | 8,088 | 2,022 | $\$ 1,464,656$ |

\end{aligned}
$$

## HR Assistance Rendered to Employee

Type of HR Personnel: Compensation/Benefits/Employment Specialist<br>Length of Time: 1 Hour<br>Number of Participating Employees: $1 / 3 \times$ Number of Authorized Employees (Exhibit 13)

## Appendix J: Calculation of Employee Productivity Costs

The costs are calculated by multiplying the average employee wage rate by the estimated number of employer hours that will be lost. As discussed in section III.C, $\$ 27.58$ is the loaded average hourly wage rate used to reflect the opportunity cost of no-match employees' time. The total number of lost hours is calculated as a sum of lost hours for three separate activities: the initial meeting employees have with an HR representative, a second follow-up meeting, and time taken off work to visit an SSA office. The number of lost hours for each of these components is a product of the number of no-match employees who participate in the activity and each activity's length of time. These variables are specified below for each activity. Note that the number of authorized and unauthorized no-match employees in Exhibits 12 and 13 is presented both by size class and the percentage of no-match employees assumed to be unauthorized.

## Initial Meeting with HR

> Length of Time: 1 Hour Number of Participating Employees: $\quad$ Number of Unauthorized Employees (Exhibit 12)        - Number of Authorized Employees (Exhibit 13) * Number of Authorized Employees ${ }^{109}$

## Second Meeting with HR

| Length of Time: | 1 Hour |
| ---: | :--- |
| Number of Participating Employees: | $1 / 3$ * Number of Authorized Employees (Exhibit 13) |

Day Off Work

Length of Time: 8 Hours
Number of Participating Employees: $1 / 3$ * Number of Authorized Employees (Exhibit 13)

[^52]
## Appendix K: Calculation of Miscellaneous Costs

Miscellaneous costs include expenditures on phone, postage, and printing. For each of the resources, the cost is a function of a unit cost estimate and the total number of units that are used. The total number of units that are used is equal to the number of employees that either utilize the resource or to which the resource applies multiplied by the number of units per employee. Note that the number of authorized and unauthorized no-match employees in Exhibits 12 and 13 is presented both by size class and the percentage of no-match employees assumed to be unauthorized. The variables used to estimate the costs of the resources are presented below.

## Phone

| Number of Employees: | $1 / 3$ * Number of Authorized Employees (Exhibit 13) |
| ---: | :--- |
| Number of Units per Employee: | 1 Hour |
| Cost per Unit: | $\$ 6.00$ per Hour |

## Postage

Postage costs are based on (1) the number of letters initially used to contact employees about their no-match status and (2) other letters sent by HR while helping employees resolve their status (e.g., a request for a birth certificate). The number of employees affected by these two endeavors is not the same.

| Initial Letter | Number of Employees: | Number of Unauthorized Workers (Exhibit 12) <br> + Number of Authorized Workers (Exhibit 13) <br> $-1 / 3$ * Number of Authorized Employees ${ }^{110}$ |
| :---: | :---: | :---: |
|  | Number of Units per Employee: | 1 Stamp |
|  | Cost per Unit: | \$0.50 per Stamp |
| Second Letter | Number of Employees: | $1 / 3$ * Number of Authorized Employees ${ }^{111}$ |

[^53]
## Printing

Printing costs are based on (1) the number of letters initially used to contact employees about their no-match status and (2) forms, letters, or other information printed by HR while helping employees resolve their status. The number of employees affected by these two endeavors is not the same.

| Initial Letter | Number of Employees: | Number of Unauthorized Workers (Exhibit 12) <br> + Number of Authorized Workers (Exhibit 13) <br> $-1 / 3$ * Number of Authorized Employees ${ }^{112}$ |
| :---: | :---: | :---: |
|  | Number of Units per Employee: | 1 Page |
|  | Cost per Unit: | \$1.00 per Page |
| Second | Number of Employees: | $1 / 3$ * Number of Authorized Employees ${ }^{113}$ |
|  | Number of Units per Employee: | 9 Pages |
|  | Cost per Unit: | \$1.00 per Page |

[^54]
## Appendix L: Estimation of Revenues per Firm

As noted in the text, the data on receipts for non-agricultural industries include a size class (20-99 employees) that combines two of the size classes used in this analysis (2049 employees and 50-99 employees). This appendix describes the procedures used to allocate the following data for the 20-99 employee size class into estimates for the 20-49 and 50-99 employment size classes:

| Exhibit L.1: $\mathbf{2 0 0 2}$ SBA Data for the 20-99 Employment Size Class |  |
| :--- | :---: |
| Number of Firms | 508,249 |
| Total Receipts (000) | $2,884,696,648$ |

The methodology that was used can be summarized as follows. First, a procedure was used to construct a distribution of firm sizes for firms with 20-99 employees. For example, the algorithm estimated the percentage of total firms in the 20-99 size class comprised of firms with 37 employees (percentages for all the other specific employment levels between 22 and 99 were estimated as well). This percentage was then multiplied by the number of firms with $20-99$ employees $(508,249)$ to estimate the number of firms with only 37 employees.

Next, a simple regression was estimated in which receipts per firm were related to employment per firm. The slope coefficient of the regression was multiplied by each specific employment level between 22 and 99 to produce a vector of receipts per firm for each level of employment. The receipt-per-firm estimates were then multiplied by the corresponding number of firms at each employment level (estimated in the first step above) to estimate the total receipts for each employment level (e.g., 37). These total receipt estimates were subsequently calibrated so that they would sum to the level of receipts for the $20-99$ size class $(2,888,696,648)$. Finally, the estimated number of firms and receipts were aggregated into the desired size classes (20-49, 50-99).

## Distribution of the Number of Firms to Specific Employment Levels

The procedure used to create the size distribution is based on the same regression analysis utilized in Appendix A to distribute the SSA no-match counts. As noted earlier, that analysis relies on SBA data on firm counts and number of employees by size class for 2004 (see Exhibit B. 1 in Appendix B). The specification uses a power trend to relate the percentage of total firms by size class to the average number of employees per firm by size class. See Appendix A for more details.

The coefficients were used to develop initial estimates of the percentage of firms for each discreet employment level (e.g., 37). The estimated percentages were then calibrated so that they would sum to 100 percent. Multiplying the percentages by the number of firms
in the class $(508,249)$ estimates the number of employers for each discreet employment level.

These calculations are reproduced in the following table. Derived from the regression coefficients, the $2^{\text {nd }}$ column reports the estimated percentage of firms accounted for by employers with the average number of people employed in the first column. For example, the first row shows the regression prediction that firms with 20 employees comprise 10.8 percent of all employer firms. This figure was computed as follows: $10.8 \%=0.4235 * 20^{-8927}$. This $10.8 \%$ figure was then calibrated by dividing it by $458 \%$, the sum of the predictions for those 79 employment levels. The result, $2.38 \%$, was multiplied by 508,249 (the total number of firms listed in Exhibit L.1) to produce 12,075: an estimate of the number of firms with 20 employees.

| Exhibit L.2: Estimated Number of Firms by Employment Size |  |  |  |
| :---: | :---: | :---: | :---: |
| Employment Size (Number of Employees) | Percent of Firms (Regression Prediction) | Calibrated Percent of Firms for Size Class | Estimated Number of Firms |
| 20 | 10.8\% | 2.38\% | 12,075 |

| 94 | $3.7 \%$ | $0.82 \%$ | 4,153 |
| 95 | $3.7 \%$ | $0.81 \%$ | 4,123 |
| 96 | $3.7 \%$ | $0.81 \%$ | 4,093 |
| 97 | $3.6 \%$ | $0.80 \%$ | 4,064 |
| 98 | $3.6 \%$ | $0.79 \%$ | 4,036 |
| 99 | $3.6 \%$ | $0.79 \%$ | 4,007 |

The estimates of the number of firms in the fourth column were aggregated into the desired employment size classes using the employment levels in the first column. To compute the number of employers in the 20-49 employment size class, the first 30 rows of the fourth column were summed. For the 50-99 employment size class, all of the remaining rows were summed.

## Estimation of Revenues for Specific Employment Levels

Regression analysis was used to estimate the relationship between revenues per firm and employment per firm. Exhibit L. 3 depicts the results of the regression analysis in a graphic. Note the high $\mathrm{R}^{2}$ and linear relationship.

Exhibit L. 3

The slope coefficient of the regression $(240,703)$ was multiplied by each specific employment level between 22 and 99 to produce a vector of receipts per firm for each level of employment. The results are shown in the second column in Exhibit L.4. In the first row, for example, 4,814,081 equals $20 * 240,703$.

The third column in Exhibit L. 4 reproduces the corresponding number of firms estimated in Exhibit L. 2 above. Multiplying the receipt-per-firm estimates (second column) by the number of firms in the third column yields an initial estimate for total receipts for each employment level. To illustrate: in the fourth column of the first row, $\$ 58,131,979,515$ equals $\$ 4,814,081$ average receipts per firm * 12,075 firms. Dividing the figures in column 4 by the sum of that column produces the percentages in the fifth column. Multiplying those percentages by $\$ 2,888,696,648$ (total revenues for the 20-99 size class) produces the final revenue estimates reported in column 6.

|  | Exhibit L.4: Revenues by Employment Size |  |  |  |  |
| :---: | :---: | ---: | ---: | ---: | :---: |
| Employment <br> Size <br> (Number of <br> Employees) | Receipts per <br> Firm <br> Regression <br> Prediction) | Estimated <br> Number of <br> Firms | Total Revenues <br> (First Estimate) | Percent of <br> Total | Revenues <br> Revenues |
| 62 | $14,923,651$ | 5,534 | (Final |  |  |
| Estimate) |  |  |  |  |  |

Finally, the revenue estimates in column 6 were aggregated into the desired size classes (20-49, 50-99) using the employment levels in the first column. To compute the total revenues for the 20-49 employment size class, the first 30 rows of the sixth column were summed. For the 50-99 employment size class, all of the remaining rows were summed.

[^0]:    ${ }^{1}$ GAO, Social Security: Better Coordination among Federal Agencies Could Reduce Unidentified Earnings Reports (GAO-05-154), Report to Congressional Committees, February 2005.

[^1]:    ${ }^{2}$ The data in the graph were reported in Migration Policy Institute, Social Security "No-Match" Letters: A Primer, in Immigration Backgrounder, October 2007, No. 5. The unauthorized population estimates come from Michael Hoefer, Nancy Rytina, and Christopher Campbell, Office of Immigration Statistics, DHS, Estimates of the Unauthorized Immigrant Population Residing in the United States: January 2006, Population Estimates, August 2007. Data on the number of letters by State were obtained from SSA at http://www.ssa.gov/legislation/EDCOR\%20Notices\%20By\%20State\%20TY06\%20-\%20080407.pdf.

[^2]:    ${ }^{3}$ SBA, The Small Business Economy: A Report to the President, 2007, p. 11.

[^3]:    ${ }^{4}$ This assumption is generally made when there are fixed costs that are the same for all firms regardless of size.

[^4]:    ${ }^{5}$ The SBA size standards listed in Exhibit 2 include the most common size standards. According to http://www.sba.gov/services/contractingopportunities/sizestandardstopics/faqs/index.html, about one-fourth of industries have a size standard that is different from these common levels. They vary from $\$ 0.75$ million to $\$ 32.5$ million for size standards based on average annual revenues and from 100 to 1,500 employees for size standards based on number of employees.

[^5]:    ${ }^{6}$ Although SSA could not provide us with the detailed ESF data, they were able to provide us with aggregate tabulations of that data as long as those tabulations did not violate any confidentiality restrictions.

[^6]:    ${ }^{7}$ Including farms, we estimate that there are $2,426,416$ firms in the country that employ more than four people. See Appendix B and Appendix D for more details.
    ${ }^{8}$ Some firms have more than 1 EIN for tax purposes.
    ${ }^{9}$ Obtained from the U.S. Small Business Administration, Office of Advocacy, at www.sba.gov/advo/research/data uspdf.xls. The figures are based on data provided by the U.S. Census Bureau. See Appendix B for more information on how the numbers were derived
    ${ }^{10}$ The number of farms by employment size class was derived from the 2002 Census of Agriculture, which provides data on the number of farms and the number of hired workers for different economic classes. It should be noted that the number of farms that utilize hired worker constitute only 26 percent of the total number of farms in the U.S. See Appendix D for more information on the data used for the agriculture sector.

[^7]:    ${ }^{11}$ Based on an analysis of data received from SSA on November 6, 2007. See Appendix A for a description of how the data were used to compute these numbers.
    ${ }^{12}$ Refer to the above text and Appendix B for information on how these numbers were derived.

[^8]:    ${ }^{13}$ DHS requested information from SSA to assist in better identifying the number of small entities that could be expected to establish safe-harbor procedures. Specifically, DHS requested that SSA provide the names and addresses of the companies already identified by SSA in its preparation to release no-match letters in September 2007. This raw data would have permitted DHS to conduct research to determine the North American Industry Classification System industry to which the specific companies belonged, to research the annual revenue and/or the number of employees of these companies, and thus attempt to apply the appropriate small business size standards. With these analyses, DHS anticipated that it would have been able to provide a rough estimate of the number of employers expected to receive a no-match letter that met the SBA's definitions of small businesses. However, SSA declined to provide DHS with the names and addresses of the employers expected to receive a no-match letter, citing the general legal restrictions on disclosure of taxpayer return information under section 6103 of the Internal Revenue Code of 1986, 26 U.S.C. 6103.

[^9]:    ${ }^{14}$ The corresponding revenue and employment figures were determined using the approach outlined in Appendix L.
    ${ }^{15}$ These numbers are derived from the second and third columns in Exhibit 4 by summing the number of employers below the employment threshold. Linear interpolation was used for thresholds that fall in the middle of one of the size classes. For example, the number of no-match employers with less than 44 employees was calculated as the following: 6,725 (number of no-match employers with 11-19 employees) $+(42,879$ (number of no-match employers with 20-49 employees) $*((43-20+1) /(49-20+1)))$.

[^10]:    ${ }^{16}$ SSA OIG, Employers with the Most Suspended Wage Items in the 5-Year Period 1997 through 2001 (A-03-03-13048), October 2004.
    ${ }^{17}$ Both SIC codes and NAICS codes define industry sectors used to classify business entities for the purposes of collection, analysis, and publication of statistical data. NAICS has recently replaced SIC as the preferred system. See Census websites such as http://www.census.gov/epcd/www/drnaics.htm for more detail.
    ${ }^{18}$ GAO, Social Security: Better Coordination among Federal Agencies Could Reduce Unidentified Earnings Reports (GAO-05-154), Report to Congressional Committees, February 2005.
    ${ }^{19}$ Industry identification was based on Standard Industrial Classification (SIC) codes.
    ${ }^{20}$ Electronic file (MS Excel spreadsheet) received from GAO on December 3, 2007.
    ${ }^{21}$ Each industry included in the "All Others" category constitutes less than 1 percent of the 1.8 million employers with industry codes.

[^11]:    ${ }^{22}$ U.S. Census Bureau, County Business Patterns, 2005. For special trade contractors (NAICS 238), there were 493,278 establishments in 2005, out of which 313,191 employed 1-4 people. For eating and drinking places (NAICS 722), there were 540,933 establishments, out of which 192,869 employed 1-4 people.

[^12]:    ${ }^{23}$ Computations for non-agricultural industries based on data from U.S. Census Bureau, County Business Patterns, 2005: see Appendix E for more detail. See Exhibit D. 6 in Appendix D for details on the estimates for the agriculture sector.
    ${ }^{24}$ Computations for non-agricultural industries based on data from U.S. Census Bureau, County Business Patterns, 2005: see Appendix E for more detail. See Exhibit D. 6 in Appendix D for details on the estimates for the agriculture sector.

[^13]:    ${ }^{25}$ This analysis follows the standard "compliance" terminology for a Regulatory Flexibility Analysis. We understand, however, that the safe harbor established in this rule does not mandate behavior from employers, and so the rule does not impose "compliance" obligations on employers. While we choose to adhere to the standard terminology for this analysis, the costs calculated here are the costs that employers may incur should they decide to follow the safe-harbor procedures set forth in the rule.
    ${ }^{26}$ Mark Evers, Commissioner of Internal Revenue, Individual Taxpayer Identification Numbers and Social Security Number Matching, Prepared Testimony before the House Ways and Means Subcommittee on Oversight and Subcommittee on Social Security, March 2004 in SSA OIG, Employers with the Most Suspended Wage Items in the 5-Year Period 1997 through 2001 (A-03-03-13048), Appendix G, October 2004.

[^14]:    ${ }^{27}$ Section $274 \mathrm{~A}(\mathrm{a})(1),(2)$ of the Immigration and Nationality Act (INA), 8 U.S.C 1324(a)(2).

[^15]:    ${ }^{28}$ Includes both voluntary and involuntary separations.
    ${ }^{29}$ Note that the separation rates are annual rates. Therefore, the accuracy of the separation estimates depends upon when the no-match letters are sent out. These estimates could be understated if the letters are not sent out until late 2008. On the other hand, actual separations for future tax years could be lower than what is currently estimated if the majority of the letters are mailed before one year has elapsed.

[^16]:    ${ }^{30}$ See Appendix A for information on data sources and derivation of the numbers.
    ${ }_{32}^{31}$ The numbers in this column are equal to the number in the second column multiplied by 57.1 percent.
    ${ }^{32}$ The numbers in this column equal the difference between the second and third columns.

[^17]:    ${ }^{33}$ This table includes only the number of no-match employees on staff when the firm receives the no-match letter. See Exhibit 10 for details.

[^18]:    ${ }^{34}$ This table includes only the number of no-match employees on staff when the firm receives the no-match letter. See Exhibit 10 for details.
    ${ }^{35}$ U.S. Bureau of Labor Statistics, Department of Labor, Occupational Employment Statistics (OES) Survey, May 2006.
    ${ }^{36}$ The percentage of no-match letters sent to each State was derived from SSA, EDCOR Notices by State TY 2006 - 080407. It was initially thought that the weighted averages would be more appropriate than national averages, but on comparison the two series turned out to be extremely close. With the exception of the Human Resources Assistant, all the differences were less than 65 cents. The weighted average wage for the Human Resources Assistant was $\$ 2.32$ higher than the national average. See Appendix G for more information on how the wage rates were computed.

[^19]:    ${ }^{37}$ U.S. Bureau of Labor Statistics, Employer Costs for Employee Compensation, September 20, 2007. This program is based on the National Compensation Survey, which measures employment costs for private and State and local government employers.

[^20]:    ${ }^{38}$ Firms who turn to in-house lawyers are still considered to be purchasing time from those individuals.
    ${ }^{39}$ An abundance of legal white papers on the no-match issue can be found on the Internet. It is assumed that many employers will turn to such material rather than hiring legal counsel.

[^21]:    ${ }^{40}$ See Appendix H for information on the derivation of these numbers.
    ${ }^{41}$ See Exhibit 13 for this number.
    ${ }^{42}$ See Exhibit 4 for this number.

[^22]:    ${ }^{43}$ In other words, 31.33 percent ( $33.33 \%-2 \%$ ) of current authorized employees are assumed to resolve their no-matches in the third stage.
    ${ }^{44}$ Declaration of Kenneth S. Apfel in Support of Temporary Restraining Order and Preliminary Injunction, Plaintiff's Memorandum in Support of Motion for Temporary Restraining Order and Preliminary Injunction, AFL-CIO v. Chertoff, No. 07-4472-CRB, D.E. 6, $\mathbb{\|} 17$ (N. D. Cal. Aug. 29, 2007).

[^23]:    ${ }^{45}$ For example, see Morgan Lewis and Bockius LLP, Social Security No-Match Letters, white paper, September 2007, pp. 4-5, http://www.morganlewis.com/pubs/SocialSecurityNo-MatchLetters_WhitePaper.pdf
    ${ }^{46}$ This value is equal to the loaded wage rate of the compensation and benefits manager $* 0.25$ hours plus the loaded wage rate of the compensation and benefits specialist * 0.5 hours: or $(\$ 57.28 * 0.25)+(\$ 37.23 *$ $0.5)$.
    ${ }^{47}$ Note that in a test it took us less than 5 minutes to screen 100 SSNs. On average, there will be approximately 65 employees listed on each no-match letter.

[^24]:    ${ }^{48}$ It is assumed that one-third of the authorized employees were able to resolve their no-match status during the initial record review.
    ${ }^{49}$ In other words, it is assumed that individual meetings will be held with all of the remaining unauthorized employees plus two-thirds of the remaining authorized employees. It is assumed that one-third of the remaining authorized employees were able to resolve their no-match status during the initial record review.

[^25]:    ${ }^{50}$ See Exhibit 4 for this number.
    ${ }^{51}$ See Exhibit 10 for this number.
    ${ }^{52}$ The number 16,788 is derived from adding the 2,398 unauthorized employees from Exhibit 12 to twothirds of the 21,585 authorized employees from Exhibit 13: $((2,398)$ X $2 / 3(21,585))=16,788$.
    ${ }^{53}$ See Exhibit 13 for this number.

[^26]:    ${ }^{54}$ Westat, Interim Findings of the Web-Based Basic Pilot Evaluation, report prepared for the Department of Homeland Security, December 2006, p. IV-17.
    ${ }^{55}$ Westat, INS Basic Pilot Evaluation, January 2002.

[^27]:    ${ }^{56}$ Recall that although the termination and replacement of unauthorized employees will impose a burden on employers, the INA expressly prohibits employers from knowingly hiring or knowingly continuing to employ an alien who is not authorized to work in the United States. Accordingly, these costs are attributable to the INA, not to the regulations setting out DHS's interpretations of knowledge and providing for a safe harbor.
    ${ }^{57}$ See Exhibit 12 for this number.
    ${ }^{58}$ See Exhibit 13 for this number.

[^28]:    ${ }^{59}$ Recall that we are using a fully loaded wage rate of $\$ 27.58$ per hour as a proxy for the opportunity cost of time.
    ${ }^{60}$ See Exhibit 4 for this number.
    ${ }^{61}$ It is assumed that one-third of the authorized employees were able to resolve their no-match status during the initial record review.
    ${ }^{62}$ As discussed in Section III.J, it is assumed that $98 \%$ of current authorized employees will be able to resolve their no-matches.

[^29]:    ${ }^{63}$ Although some employers will file their corrections electronically with SSA, the cost for printing and mailing corrected $\mathrm{W}-2 \mathrm{~s}$ is estimated for all employers.

[^30]:    ${ }^{64}$ See Exhibit 13 for this number.
    ${ }^{65}$ See Exhibit 12 for this number.
    ${ }^{66}$ See Exhibit 4 for this number.

[^31]:    ${ }^{67}$ There are several internet sites that provide a "cost of turnover" worksheet listing the most common types of turnover costs. Examples of these worksheets are found at http://www.uwex.edu/ces/cced/economies/turn.cfm and at http://www.dol.gov/cfbci/turnover.htm.

[^32]:    ${ }^{68}$ Hinkin, Timothy R. and J. Bruce Tracey (June 2000) "The Cost of Turnover: Putting a Price on the Learning Curve." Cornell Hotel \& Restaurant Administration Quarterly Vol. 41, No. 3, pp. 14-21.

[^33]:    ${ }^{69}$ Using the CPI Inflation Calculator from the Bureau of Labor Statistics, the factor needed to convert year 2000 dollars to year 2007 dollars is 1.22 . For example, the cost to replace a gift-shop clerk of $\$ 3,383$ found in the study in year 2000 is equivalent to a cost of $\$ 4,127$ in 2007 dollars.
    ${ }^{70}$ Pollin Robert and Mark Brenner (2000) "Economic Analysis of the Santa Monica Living Wage Proposal." Amherst, MA: Political Economy Research Institute, University of Massachusetts.
    ${ }^{71}$ Seavey, Dorie (October 2004) "The Cost of Frontline Turnover in Long-term Care." Better Jobs Better Care Practice \& Policy, Institute for the Future of Aging Services.
    ${ }^{72}$ Frank, Blake (January 2000) "New Ideas for Retaining Store-Level Employees" Coca-Cola Retailing Research Council.
    ${ }^{73}$ Recall that the factor needed to convert year 2000 dollars to year 2007 dollars is 1.22 . Therefore, using year 2007 dollars, the turnover cost for replacing a supermarket cashier ranges from $\$ 2,789$ to $\$ 5,262$.
    ${ }^{74}$ While we do not know the specific occupations receiving the no match letters, we have previously presented information that shows the no-match employees are likely to be clustered in the service, retail, and agricultural sectors.

[^34]:    ${ }^{75}$ See Exhibit 13 for this number.
    ${ }^{76}$ See Exhibit 4 for this number.

[^35]:    ${ }^{77}$ Employment per firm data were obtained from Exhibit B. 1 in Appendix B.

[^36]:    ${ }^{78}$ www.sba.gov/advo/research/data_uspdf.xls $\backslash u s 02 n$ mi.
    ${ }^{79}$ http://data.bls.gov/cgi-bin/cpicalc.pl.
    ${ }^{80}$ The percentages in the graph were derived from the estimates presented in Exhibit 4.

[^37]:    ${ }^{81}$ These figures were tabulated by employer, not by employer report. An employer report consists of a W3 form and all corresponding W-2 forms that employers submit as a package to SSA at the beginning of each year. Paper filers are supposed to send their reports by the end of February and electronic filers by the end of March. On rare occasions, an employer will submit more than one report for the year. A no-match letter is generated for each employer report that meets the no-match criteria. Employers who submitted multiple reports could have submitted some reports that met the criteria for receiving a no-match letter, and other reports that did not meet the criteria even though there may have been no-matches on them (a report must include at least 11 no-matches in order to generate a no-match letter). To illustrate, consider a hypothetical employer who submits two employer reports for the year. Assume the first report includes 20 no-matches, and therefore generates a no-match letter. Assume that the second report contains only 5 nomatches, which means it does not generate a letter. This employer would receive one no-match letter with only 20 SSNs listed, even though the employer submitted a total of 25 no-matches for the year. In this case the data tabulated in Exhibit A. 1 would show 25 employees. Based on conversations with SSA personnel, it appears that employers rarely submit multiple reports, and the effect upon the tabulations is expected to be minimal.

[^38]:    ${ }^{82}$ The percentages for each W-2 size class sum to 100 percent.

[^39]:    ${ }^{83}$ Obtained from the U.S. Small Business Administration, Office of Advocacy, at www.sba.gov/advo/research/data_uspdf.xls. The figures are based on data provided by the U.S. Census Bureau.
